The Pediments.—Some careful old drawings, until recently attributed to Carrey, one of the artists who worked for the Marquis de Nointel in the East, 1673-75, are essential documents for the study of the sculptures. On reconsideration it has seemed more probable that the drawings were by a Flemish draughtsman, and not by Carrey; the older tradition was to this effect: Stuart (*Athens*, Vol. II, following Montfaucon) speaks of them as by a young Flemish painter. It will be well to name them the Nointel drawings and call the author "Nointel's painter," as is done by Lechat, who points out that they were executed under the direction of the Marquis and might well bear his name. The drawings are little more than outline sketches, yet comparison with what has been preserved shows that they may be trusted for parts represented which have been lost. They must for the most part have been made from the ground level, and this would account for the fact that some of the figures seem somewhat short and extended laterally.

All the sculptures were concerned with Athena, and those of the pediment on the eastern or principal font represented her birth. "Among the Athenians delight in the beauty of the sculptures was accompanied by enthusiastic interest in the subjects. Belief in the sacred legends was still alive. It was as an inspired bard that Pheidias announced the birth of Athena and told [in the west gable] how Poseidon and Athena strove for the possession of the dear native land, and how the goddess with whom the Athenians felt themselves identified was the victor in the noble strife" (Kekulè). Comparison of what is known of these pedimental sculptures with other similar great works, especially those at Olympia, show that each space was entirely filled and that there were overlappings and linkings which bound the several units into one continuous composition and great unity. The figures were not set up like objects ranged on a shelf, but they were close together and adjusted at various angles, they were pushed into the acute lateral angles of the triangular spaces and their heads rose close to, and in some cases partly projected above, the inclined line of the corona.

The general advanced plane of the sculptures was several inches in front of the face of the cornice on which they rested; this is most evident in the existing head of the horse of Selene's chariot (Fig. 4). The nose of the outer horse of the chariot of Helios pro-

Fig 3 (restored).

jected in the same way, so, also, it would appear, did some of the feet of the seated goddesses, and indeed parts of all the most prominent figures. This fullness of the two great sculpture areas is well suggested by the admirable model in the museum, in which little wax figures modelled by Lucas are set in place*. Similar fullness and projection is found in the more archaic pediments of Ægina as restored by Furtwängler at Münich.

Each of the great pedimental groups expressed a single ruling thought and represented one moment in time. In both the groups there is a movement of excitement throughout all the figures. The unifyi agency in the eastern pediment was probab imagined as the shout of Athena: "Fe took hold of them at the sight . . . and t earth on every side rang with the terrib cry. Hyperion's bright son stayed his gallo

Fig. 4 (restored).

ing steeds for a space" (*Homeric Hymn* In the western gable the key of the action to be found in a blast of wind—"Poseidon' breath"—which struck all who were presen and wakened those who slept with a commo thrill.

The moment of time imagined in th eastern pediment was sunrise, and it wa probably the same in the other also, as suggested by the waking figures. Ther would have been folk tales that at the righ instant the wonderful figures stirred in thei places. These were not "architectural deco rations." They were religious and nationa stories.

Eastern Pediment.—The assemblage o great sculptures in this pediment representin the "Birth of Athena"—that is her firs appearance amongst the gods—were disposed in a way which may be suggested thus :—

		THE CENTRAL ACTION		
SUN	SPECTATORS		SPECTATORS	MOO

In the centre of the pediment, as is gener ally agreed, were two chief figures, Zeus en throned, and in front of him what mus have been a superb creation, the fully-arme Athena. With these were probably Hera an Hephaestos, while the other high gods wer on either hand. In several proposed restora tions, including the most recent by Dr. A. B Cook, in his *Zeus*, Hephaestos is placed be hind the throne of Zeus. If, however, torso at Athens belongs to this figure, it was as I believe was first suggested by Watkis Lloyd, probably on the right behind Athena Furtwängler, in his book on Ægina, accepte this arrangement; so more recently ha Lechat, and Collignon was inclined to th same view. By this arrangement the fou chief actors would have appeared in the sam order as on the eastern frieze—Hera, Zeus Athena, Hephaestos. Dr. Cook, in assign ing places to several fragments, suggests tha a wing of considerable size may have be longed to a figure of Nike flying betwee Zeus and Athena, as on a late relief of th subject. The scale of such a figure, how ever, would have been greater than that sug gested by the relief, and Collignon was i doubt as to there having been even a smal scale flying figure. Sauer, he pointed ou thought the fragments of marble wings whic exist could not have belong to such a Nik The support of a large flying figure woul have been a great problem, and I doul whether it existed.

(To be continued.)

* This artist seems to have been the author of the wax bust attributed to Leonardo at Berlin, and here we have works in wax certainly done by him.

Fig. 2.

A New Cinema, Torquay.

The Torquay magistrates have given fo mal approval to the plans of a new cinemat graph theatre to be erected at Hamnt Place, St. Marychurch, by Major A. O. Ell of Homeside, Torquay.

EAVES FROM A SKETCH BOOK OF 1887

his pair of very amusing skits were made y years ago by the well-known architect, J. Tarver (1841-1891), of Craig's Court, tehall, who was intimately associated H. W. Lonsdale, with whom he pub- d a standard book on "Mediæval Cos- es," 1874. Shortly before the battle l about "the Principles of Architectural oration" was fought out at Conduit et, Tarver presided over the Architec- l Association there. The protagonists in fray were John J. Stevenson (1832-1908) Sir George Gilbert Scott, R.A. (1811-), George Edmund Street, R.A. (1824-), the Rt. Hon. A. J. B. Beresford Hope, . (1820-1887), Benjamin Ferrey (1810-), also others took part, including Lord thorpe (then Sir Edmund Beckett, Bart., (1815-1905). Ever ready for disputa- s, the last-named responded to a call the President, Mr. Charles Barry (1823-), by launching a tilt at the Society for Preservation of Ancient Buildings, who, aid, "invented what they call principles run wild upon them and call upon other le to admit them as if they had been onstrated." "For myself," said he, e older I grow the more *unprincipled* I me!" His drastic alterations carried in St. Albans Abbey amply confirm his gard for historic architecture. His own ries amply justify J. J. Stevenson's cisms, designated by Grimthorpe as iggery" calling the S.P.A.B. "copy " for emulating Ruskin's anti-restoration ade twenty-five years previously.

his lively controversy (now almost for- en) continued for years to engage periodi- the attention of the profession, and J. Tarver, full of fun, and as militant as ooked, joined in by deriding the extra- nces of the "anti-scrapists," who no ot sometimes talked nonsense. Moreover, n employed on restoration work, some bers of that party did pretty much the e kind of patching up and replacing t which like methods they loudly pro- d when similar displacements happened e done by someone else. E. J. Mickle- ite, F.S.A. (1843-1906), who repaired Wren's western towers at Westminster Abbey, by using new masonry promiscuously, himself protested quite needlessly against the strictly careful and conservative renovations by G. F. Bodley, R.A. (1827-1909), carried out with Mr. Irvine as Clerk of Works on the west fronts of Peterborough Cathedral.

Tarver's sketches traversed the "do nothing principle" but "shore up" and "patch here and there," or (as he shows by the exterior view) cover in with glass the rotting ruins of mediæval treasures while handling churches as remnants of the past as mere archæological samplers with no consideration of keeping up places of public worship in a sufficient condition for daily use by priest and people.

Twixt now and then these differing parties have grown more reasonably inclined. Gothic taste has been supplanted by iron-framed construction and so-called classic ideals. The extremists of the Tractarian Movement have simmered down and "over restoration" has been moderated save perhaps an occasional case which warrants the outcry on behalf of the public generally. A far more willing support of the Society for the Protection of Ancient Buildings is manifest, specially its well-directed endeavours to preserve Waterloo Bridge lately.

Nowadays the problem as to old buildings is associated with the devastation of the country side coupled with the weight of taxation hampering the upkeep of country mansions and rural seats. The development of the housing difficulty, too, and growing motor traffic combine by interfering with historic wayside and village architecture. The Press occasionally issues comic sketches of contemporary instances of such incongruous happenings, but few satirical skits appear which compare with Tarver's two clever sketches not hitherto published. Curiously enough, they have all these years been preserved with also equally unique photographs of Lord Grimthorpe's autograph studies for the new west façade of St. Albans Abbey as well as his odd scheme for filling the great rood on the high altar screen. The incongruity of these drafts has, in a sense, been emphasised by housing them in the writer's copy of the splendid monographic folio of drawings of St. Albans Abbey, published by James Neale, F.S.A. (1851-1909), in 1887, showing this magnificent church before its transmogrification. Tarver gave these studies to his friend, Mr. Maurice B. Adams, who obtained the photographs of Lord Grimthorpe's "uprights" from his Clerk of the Works, Mr. Chappell, at the Abbey, when the renovations were in progress.

New Bournemouth Cinema.

We learn that the new cinema to be built in Bournemouth, of which details were given in our issue last week, will be erected from the designs of Mr. W. E. Trent, architect to the Provincial Cinematograph Theatres, Ltd., in collaboration with Messrs. Seal and Hardy, of Bournemouth.

Woodwork in Old Streets.

The following letter on this subject has been addressed to the *Times* by Mr. S. Tugwell, F.R.I.B.A. Referring to the specimens of 18th century woodwork in our streets, he says :—"These examples are quite beyond the province or the aim of the State to reach, but are of great interest and value to preserve. In numerous cases they consist of external doorways of refinement and beauty, usually made of pine and soft wood, whose life is now drawing to its close. In the majority of our towns there exists sufficient public interest, if focused and guided, to preserve many of these examples, and to the growing section of the public who value craftsmanship and beauty, and who seek to retain it in our midst, the following suggestions are addressed—namely, that an address be given before some local society interested in art, and co-operation invited; that a list be compiled of the best local examples of doorways, chimneypieces, staircases, etc., with complete photographic records combining their settings and surroundings, and where possible with measured drawings; that these records be made available in the local libraries and museums for reference; and, when buildings are demolished, representative examples of local work be secured for the local museums."

Leaves from a Sketch Book, 1887. By E. J. Tarver.

SOCIETIES AND INSTITUTIONS

Sketching and Measuring Public Buildings in Europe.

The following précis of information received from R.I.B.A. Honorary Corresponding Members with reference to the regulations for sketching and measuring public buildings in the various countries of Europe has been prepared by the Board of Architectural Education. The précis will in future be printed in the R.I.B.A. Kalendar and in the R.I.B.A. Travelling Card for the information of those proceeding abroad.

R.I.B.A. Travelling Card.

France.—A special permit must be obtained from the Direction des Beaux-Arts, Commission des Monuments Historiques, in France. An application for a special permit must be accompanied by a letter from the British Embassy in Paris, to which the R.I.B.A. Travelling Card should be produced.

Austria.—The Federal Monuments Committee, 1, Auerspergstr, Vienna VIII, will render every assistance to holders of the R.I.B.A. Travelling Card by giving letters of introduction to the responsible authorities.

Belgium.—Students should apply for permission to the Town Council of the town in which they wish to pursue their studies.

Sweden.—Public buildings may be sketched and measured without any special permission from the authorities.

Germany.—Students should apply to the British Embassy in Berlin for letters of introduction to the Ministry of Art who grant the necessary permits.

Denmark.—Students should apply for permits to the Department of Public Instruction at Copenhagen.

Switzerland.—Students should apply for permits to the Town Council of the town in which they wish to pursue their studies.

Holland.—Students should apply to the Commission of Care for Monuments, The Hague, which will render every assistance to holders of the R.I.B.A. Travelling Card.

Italy.—(a) The Department of Antiquities and Fine Arts, Rome, grants free passes to students, permitting them to visit, free of charge, institutes of antiquities and arts. In order to obtain this free pass the student must produce a letter certifying that he is a bona-fide student of architecture (this letter is not returned). If it is desired to obtain this pass, application should be made before leaving England.

(b) The student who wishes to sketch, measure, or photograph should obtain a letter of permission from the Director of Monuments in the particular district in which he happens to be working. The British Consul in the district will furnish a letter to transmit to the local director upon production of the R.I.B.A. Travelling Card.

Spain.—Students should apply for permits to the Department of Fine Arts, Madrid, and should state in their applications:

1. The names of the monuments they desire to study.
2. The kind of work they wish to carry out.
3. The number of students in the tour.
4. By whom they are accompanied (where applicable).

Hungary.—There are no formalities, but students are advised to apply for permits from the Commission of Historical Monuments, Budapest.

Students should be prepared to produce other evidence of identity, e.g., their passports.

R.I.B.A. (Archibald Dawnay) Scholarships, 1927-1928.

In accordance with the terms of the will of the late Sir Archibald Dawnay, the R.I.B.A. have awarded one Scholarship of £75 for the academical year 1927-1928 to Mr. G. R. Beveridge of the School of Architecture, the Architectural Association, and one Scholarship of £60 for the academical year 1927-1928 to Mr. W. G. Plant of the School of Architecture, University of Liverpool. Miss C. W. Preston of the School of Architecture, the Architectural Association, who was awarded a Scholarship of £75 for the academical year 1926-1927 has been granted a renewal of her Scholarship for the year 1927-1928.

The Scholarships are intended to foster the advanced study of construction and the improvement generally of constructional methods and materials and their influence on design.

R.I.B.A. Examinations.

Following are the dates of the forthcoming R.I.B.A. examinations :—

Intermediate Examination.

November 11, 12, 14, 15, and 17, 1927 (last day for receiving applications, October 18, 1927).

May 11, 12, 14, 15, and 17, 1928 (last day for receiving applications, April 11, 1928).

Final Examination.

December 7, 8, 9, 10, 12, 13, 14, and 15, 1927 (last day for receiving applications, November 7, 1927).

July 4, 5, 6, 7, 9, 10, 11, and 12, 1928 (last day for receiving applications, June 4, 1928).

Special Examination.

December 7, 8, 9, 10, 12, and 13, 1927 (last day for receiving applications, November 7, 1927).

July 4, 5, 6, 7, 9, and 10, 1928 (last day for receiving applications, June 4, 1928).

Special Examination in Design for former members of the Society of Architects.

December 7, 8, 9, 10, and 12, 1927 (last day for receiving applications, November 7, 1927).

July 4, 5, 6, 7, and 9, 1928 (last day for receiving applications, June 4, 1928).

Special Examination of Licentiates to qualify as Fellows.

November 28, 29, 30, December 1 and 2, 1927 (last day for receiving applications, October 31, 1927).

April 16, 17, 18, 19, and 20, 1928 (last day for receiving applications, March, 16, 1928).

Statutory Examination for the Office of District Surveyor in London, and Building Surveyor under Local Authorities.

October 17, 18, and 19, 1928 (last day for receiving applications, October 1, 1928).

Town-Planning Examination.

June 27, 28, 29, and July 2, 1928 (last d for receiving applications, March 1, 1928)

CARDIFF TECHNICAL COLLEGE.

Department of Architecture and Civic Desi

At the Technical College, Cardiff, scholarships, covering tuition fees and ma tenance grants of £40 per annum for th years, are offered for competition annua As candidates for entry to the Department Architecture and Civic Design are eligible compete, these scholarships are of consid able interest to those contemplating enter the architectural profession. The scholars examination is a competitive one, and is about the same standard as matriculation. the case of candidates for the School of Ar tecture, the subjects are:—1. English. Mathematics, two papers (a) Algebra Arithmetic, (b) Geometry and Mensurat 3. A modern language (French, German Welsh). 4. Physics with Mechanics, Chemistry or Higher Maths. 5. Hist Geography or Elementary Architect Drawing. The Department has now been work for rather more than seven years un the charge of Mr. W. S. Purchon, M A.R.I.B.A., the lecturer in architecture be Mr. R. H. Winder, M.A., A.R.I.B.A., the assistant lecturer, Mr. Lewis John, M A.R.I.B.A. The following local archit assist in the work of the advanced course honorary-lecturers:—Messrs. Percy Thor V.P.R.I.B.A., Ivor Jones, A.R.I.B T. Alwyn Lloyd, F.R.I.B.A., M.T.P H. Teather, F.R.I.B.A., A. L. Thor F.S.I., M.T.P.I., C. S. Thomas, F.R.I.B J. H. Jones, F.R.I.B.A.

Students in the Department also att courses of instruction in the Department Engineering, Technical Chemistry, Mat matics, and the School of Art, all of wh are housed in the same building. This Sch of Architecture is recognised by the R.I.B which grants exemption from its Intermed examination to students who pass successf through the three-years' full-time (d course leading to the Certificate. Indivi students who pass successfully through Diploma Course are exempted from R.I.B.A. Final examination, with the ex tion of the subject of Professional Pract The Course for the Diploma consists of sessions, the former of these being of months' duration only, the intervening months being spent in architects' offices.

There is also an Evening Atelier for ar tects' assistants who cannot attend the courses. The Department is in close to with the South Wales Institute of Archit The External Examiner for the past ses was Professor A. C. Dickie, M.A., F.S A.R.I.B.A.

The School Year commenced on Tues October 4, but intending students are adv to apply at an early date for the particu of the courses of instruction and of the trance and Scholarship Examinations.

Architects', Surveyors' and Auctionee Estates.

Mr. Thomas Blagburn, of Broomfield Hale, Cheshire, surveyor to the Hale U District Council (net personalty £760), £2,046.

Mr. William Harris, of Glencourt, Hi Park, Bargoed, Glamorgan, architect, veyor, and estate agent (net personalty left £2,046.

Mr. Richard Stephenson, Knaresbor formerly of York, auctioneer and valuer £11,371.

Mr. Lucius Hurlock Reichel, of Canon Woodbury Salterton, Devon, former Beara Court, Black Torrington, architec personalty £1,155), left £2,897.

EW OFFICES OF THE MIDLAND BANK, LTD.

The first section of this new building is ring completion and the banking hall, on ground floor, is now open to the public. imately, the new head office building will end from St. Mildred's Court to Grocer's ll Court in Poultry, with a frontage of feet, and through to Princes Street, where will have a frontage of 116 feet. The tion now in occupation covers, roughly, -third of the area comprised in the scheme. e building when completed will contain ten ries and a total floor space of over six es, providing accommodation for a staff 2,400. The elevations are being carried in Portland stone. Above the cornice el the building will set back in two tiers ding up to the shallow domes which are be central and crowning features of each the frontages. The top of each dome is feet above pavement level and 200 feet m the deepest portion of the concrete ndation.

The lowest basement of the building will reserved almost entirely for engineering re- irements, including oil-fired boilers, three ep wells and pumps, water tanks, etc., ap- ratus for purifying and ozonising the air be distributed throughout the building, cuum-cleaning apparatus, electric trans- mers, switchboard room, etc. The second sement is taken up chiefly by strong-rooms, ok-rooms and stores, while that immedi- ely below the ground-level will be used for e deposits and additional strong-rooms. This ter basement contains a long corridor, hted by a circular marble opening imme- ately under the centre of the main light ll, and numerous rooms, carried out in wal- t, for the examination by customers of eds and boxes, and a large safe deposit tered by an 8 ft. circular strong-room door eighing nearly thirty tons.

The ground floor, which will be devoted tirely to general banking business, is being rried out in white marble and green ver- te, the wall filling being in white and veined arble and the shafts of the columns in green frican verdite with white marble bases. The trance lobby and joinery throughout is of ured American walnut. The centre portion the banking hall when completed will be hted by a well covered in with a coved of 80 ft. long and 40 ft. wide. At the west d of the hall there is a marble staircase ading to the safe deposits and strong-rooms the first basement.

The first, second and third floors will be voted to clearing, correspondence and other d office departments. The fourth floor will entually be occupied by the Chairman, naging directors and managerial staff gene- ly, while the fifth will comprise the board om, committee rooms, etc. On the sixth or there will be staff dining-rooms, smoking oms, kitchens, rest rooms, etc. When com- ted the building will be served by thirteen s and five staircases.

The joint architects are Sir Edwin Lutyens, A., and Messrs. Gotch and Saunders, and former is responsible for the design of front elevations, the banking hall with rble staircase, the safe deposit in the base- nt, the board room and the managerial ces.

Messrs. Holland and Hannen and Cubitt, d., are the building managers, and Messrs. e and Son, of Stockwell, the builders, The -contractors are as follows :—B. Goodman, d., demolition and excavation; Stitson, ite and Co., Ltd., plumbing, domestic hot er work and drainage; Redpath Brown Co., Ltd., constructional steelwork; Stur- nt Engineering Co., Ltd., ventilation and uum cleaning installation; Newton-Witter w Automatic Sprinkler Co., Ltd.), fire rant and alarms; F. J. Barns, Ltd., Port- d stone; Chatwood Safe Co., Ltd., strong- ms; Ruston and Hornsby, boilers; British nforced Concrete Engineering Co., design- ing and supplying reinforcement; Docker Brothers, Ltd., finishing of floors; Comyn Ching and Co., Ltd., "Dunham" system of steam heating; Becco Engineering and Chemical Co., Ltd., water plant; Higgins and Griffiths, Ltd., electric installation for lighting and general; H. T. Jenkins and Sons, Ltd., of Torquay, marble work; Henry Hope and Sons, Ltd., steel and bronze windows; A. and S. Wheater (London), Ltd., and J. Jackson and Sons, Ltd., plastering; Express Lift Co., Ltd., lifts (major portion); Medway's Safety Lift Co., Ltd., book lift; A. and P. Stevens, Ltd., lorry lift; May Construction Co., Ltd., "Cabot" quilt ceilings; W. Nicholson and Son (Leeds), Ltd., internal joinery; J. Whitehead and Sons, Ltd., marble structural work; H. Martyn and Co., Ltd., tapestry in board room and entrance gates; Benham and Sons, Ltd., kitchen plant; C. Smith and Co., ironmongery; Pilkington Asphalt Co., asphalt; Le Grand, Sutcliffe and Gell, artesian wells and pumping plant; J. Hall and Sons (London and Bristol), Ltd., glazing; London Spray and Brush Painting Co., painting; Luxfer Co., copper light glazing; Turk System Drying Co., Ltd., drying out of strong-rooms.

THE GENIUS OF THE ENGLISH CATHEDRAL

On Wednesday evening, October 5th, Sir Banister Fletcher, F.S.A., F.R.I.B.A., delivered a lecture on the origin and design of the cathedral, which was gradually evolved from earlier building types through successive periods and was enlarged and enriched as the ritual needs and devotional spirit grew. The plan, he said, may have been evolved from several sources in remote pagan days. Sometimes an ancient temple, such as that of Athena, Syracuse, was adapted, the side columns being removed or walled up as occasion served. Many believed that the Roman basilica, or law court and exchange, served as a model, for its plan, with colonnaded aisles and semi-circular "apse" at the end, closely resembled the earliest basilican churches. Some again believed that the small "scholae," for discussions among the learned, as at Pompeii, or the atria of Roman villas, were adapted to the purposes of worship when the Christians could build edifices for themselves. At all events, such early Christian "basilican churches" were the first stage of a continually changing process of plan development which could be traced in the Romanesque plans of St. Gall and the early churches of Western Europe, and culminated in the great structures erected in the Mediæval period and now regarded as triumphs of English architecture—our cathedrals.

The speaker gave a description of the chief features of the cathedrals of Western Europe, more especially of France—where the transepts are short and the east ends encircled with chapels to form a "chevet"—and of England, where double transepts, as at Salisbury, are peculiar features, aisles were usually single on each side of the nave, and green "closes" formed the rustic setting. Internally, he said, a typical cathedral was of three stages; an arcade, opening on the aisle; a triforium, sometimes called a "blind story," usually opening merely into the aisle roof; and a "clear-story," with windows high up above the aisle roof, lighting the middle of the church direct. In England, the triforium was originally as high as the clear-story, as in Norman buildings, but afterwards the aisle was heightened, as at Westminster Abbey, and eventually the triforium shrunk into insignificance.

The lecture on Wednesday next will deal with Gothic constructive principles.

OBITUARY

MR. HENRY LOVEGROVE, A.R.I.B.A., F.S.I.

It is with deep regret we record the death, on October 3rd, of Mr. Henry Lovegrove. He was nearly 82, and was only in bed for five days before he died. Mr. Lovegrove's long and distinguished service to architecture commenced in 1870, when he set up in practice as architect and surveyor, while in 1875 he was elected Associate of the R.I.B.A. He had previously studied drawing in the Taylor Gallery at Oxford. He became a Fellow of the Surveyors' Institution in 1887, in which year he was elected district surveyor of buildings of South Islington and Shoreditch. Prior to his retirement from the profession, he was hon. treasurer, hon. secretary, and finally president of the District Surveyors' Association, while in 1867 he was elected a member of the Architectural Association, of which he eventually became vice-president. Until the time of his death he was one of the three senior members. He had been for some years a member of the London Society, on whose council he served, as he did also on that of the Architects' Benevolent Society. He devoted a great part of his time to Masonic activities, and in April, 1896, he was appointed Grand Sword Bearer of England, and in 1909 P.Asst. Grand Supt. of Works. In 1925 he celebrated his Masonic Jubilee. Among his architectural works were chapels at Edmonton, Rhondda and St. Austell, schools at Exmouth, Mildenhall, Lakenheath, Combs and Stubbings, many factories and private houses; he had also a large practice as a quantity surveyor at one time. He was author of "Practical Architecture," and had read papers before many societies. Mr. Lovegrove's death will come as a great loss not to the profession only, but to his great circle of friends. He will be remembered as an architect, but even more, perhaps, for his endearing and kindly qualities, of which so many have had proof. A service will be held to-day (Friday) at 11 a.m. at Beckenham Parish Church.

MR. HENRY WARD, A.R.I.B.A.

We regret to record the death, at the age of 73, of Mr. Henry Ward, A.R.I.B.A. Mr. Ward began to study art and architecture at the age of 15, in the office of a well-known London architect. Thence he pursued his studies in Paris for some time, and eventually returned to London. Never enjoying really robust health, he first came to Hastings for that reason, about 50 years ago. It was while he was at Hastings on holiday that Mr. Ward began his association with Mr. Vernon, a local architect, whom he was eventually to succeed. He entered Mr. Vernon's office to help him for a fortnight, and remained there as a valued assistant. After a very short time he achieved a success which established his reputation in the town. He won the competition for the Hastings Municipal Buildings, which were constructed to his designs in 1881. The work brought the youthful architect recognition in his election as an Associate of the Royal Institute of British Architects—an honour conferred in those days only after some practical success. Mr. Ward succeeded Mr. Vernon as principal of the business, which he had carried on for the last 40 years. He designed many large buildings and churches, in addition to innumerable houses, throughout the south of England.

Local Land Charges.

The Stationary Rules and Orders (1927, No. 869/L.33) referring to the Land Charges, England, Act, and dated September 22, 1927, have now been issued (price 3d. net) on behalf of the Ministry of Health by the H.M. Stationery Office, Kingsway, W.C.2. The Revised Rules, which revoke the Local Land Charges Rules, 1925, will not materially affect the general form of the register of local land charges.

THE USES OF ELECTRICITY

A luncheon was given at the Hotel Cecil on Monday by the London Area Committee of the British Electrical Development Association to open the Association's winter campaign of educational advertising. Mr. A. F. Harrison, the chairman, said that 40 gatherings of the kind were being held throughout the country.

Sir James Devonshire, president of the association, and a member of the Central Electricity Board, said that the success of the campaign conducted last year for encouraging better lighting in the home was shown by the establishment of a "record" in the number of new customers. During the coming winter efforts would be made to educate the householder in the wider and more effective use of electricity for all domestic purposes. Speaking generally, the electricity undertakings of this country had reached a high pitch of technical excellence. The best of them compared favourably with anything in the world, and many of the new power plants being built and planned would be the last word in efficiency, and would embody striking inventions of recent years in converting the heat energy of coal into electric power in the most economical way. Commercially these supply undertakings were not so advanced as they might be, but there had arisen from the work of the association a great change in recent years. The new idea was that the duty to the public of this great work of national utility never really ended. It should not only provide a reasonably cheap supply, but should teach people of every class how best to use electricity with economy for all purposes and help them to get their buildings wired or acquire apparatus and maintain it in order for them. Already many supply undertakings were doing this. Under the new organisation of the electricity supply local undertakings would, in many cases, be relieved of the task of generating, but they were left with the far bigger and more responsible duty of retailing electric power on modern business lines and educating the people in its proper use. He was convinced that a positive and forward commercial attitude in the whole business could not to-day fail to justify itself.

Mr. Frank Hodges, who is also a member of the Central Electricity Board, said that British electrical development must be as high as that of any other country in the world. If it was possible by combined effort to bring the cost of electricity at the switchboard down to points equal to the lowest known throughout the world—not too great an ambition, he hoped—it was for those engaged in the distribution of electricity to see that the media through which it passed to the public were both cheap and efficient. At present, we were behind other countries in the consumption of electricity per head of the population. It was a fallacy to suppose that the colossal development of electricity and its application to industry and agriculture would bring disaster to such basic industries as coal and gas. Italy, which had developed hydro-electrical power, now used more coal than ever before. In these conditions ancillary industries were stimulated, and there was a demand for fuel. If electricity were developed as it should be in this country, and the costs of manufacturing and industrial processes came down, such a stimulus would be given to industrial development that there need be no fear of that basic industry languishing. The like was true of the gas industry. Gas and electricity ought not to be rivals, cutting each other's throat. There was ample room for development, and if they went along on some co-operative principle with fair lines of demarcation, there was no reason why they should not both develop adequately.

A Contractor's Estate.

Mr. Jesse William Chessum, contractor, of Cathedral House, Paternoster-row, E.C., who died on August 30, left £105,653.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—Ed.

Road Construction.

Sir,—I am much obliged to your correspondents who have replied to my letter which you published in your issue of August 26, and would, in reply, further explain that the vendor's agent is "making up" the road, but the local authority has laid the kerbing. The cost of "making up" the road above the natural level to the height shown in my sketch, together with the cost of material, labour, and cartage for filling in that space from the fence to the kerb (13 ft. by 2 ft.) will be considerably more than if the natural level had been carried right across the road. The chief point, however, is: should the local authority have laid the kerb to the height they have done, with the gullies 2 ft. above the footpath, or should they not have laid it to suit the level of the low side footpath, and compelled the road to be brought down to suit it? The length of the portion of the road where these conditions obtain is about 200 yds., six plots being affected. (Perhaps I should mention that the vendor's agent is not an engineer, surveyor, or contractor.)

Drysite.

Building Line.

[Reply to "Architect," September 30.]

Sir,—The building line in the street referred to comes within Section 3 of the Public Health (Buildings in Streets) Act, 1888, under which it is not lawful in any urban district (or in a rural district having like powers) to erect or bring forward any house or building in any street, or any part of such house or building, beyond the front main wall of the house or building on either side thereof in the same street without the written consent of the authority. Now, the words "house on either side thereof" mean a house within some near distance, or within some degree of proximity; and in considering what is the front main wall, the local authority must take all the circumstances into consideration. The building must be looked at as a whole; and two buildings are not necessarily in the same street because one faces the same street, or a continuation of the same street, as the other.

From the above it will be gathered that the building line is generally fixed by the first building erected in the street. The Act of 1888 only gives a local authority the power to enforce observance of this building line by a new building subsequently erected, and being near to, in the street; and it will be noticed that it is a discretionary power. "Architect" may, therefore, on representing all the facts to the local authority, obtain its consent to the concession desired. It does seem, from the particulars given, that the building line might be the one proposed, provided that the "nearer owner of the end house" will not bring it too near the centre of the road. What part of the front main wall of each of the buildings now erected is to be taken is one for the local authority to determine; and there does not appear to be any legal ruling on this matter. The fact that the roads are not yet "taken over" does not affect the question.

Law.

Concrete Blocks for Roadmaking.

Sir,—I should like to obtain information with regard to concrete or composition blocks being used in London or district for the purpose of roadmaking. If any reader could give me information regarding their manufacture and ingredients I should be obliged.

A. U.

Cleaning Aberdeen Granite.

Sir,—Can any of your readers tell me of an inexpensive and simple method of cleaning old polished Aberdeen granite which has been exposed to the weather for some 20 o years? It is, of course, essential that t materials used do not damage the polish surface.

Granite.

Elm Boarding.

[Reply to "Longing," September 30.]

Sir,—Elm is liable to excessive shrinkag and it is difficult to find any stocks seasoned as to be immune. Undertake sometimes hold good stocks of this timb and if some of this can be got hold of, it likely to be good stuff for the purpose me tioned. I agree with your correspondent th it makes very fine flooring as far as appea ance goes, and in wide boards shows a ve complete and handsome figure.

BRITISH COMMERCIAL GA ASSOCIATION CONFER- ENCE AT SOUTHAMPTO

The 16th annual conference of this associ tion was held from Monday to Wednesda of this week at Southampton. The Presider Sir Russell Bencraft, was unable to be pr sent, but his presidential address was re on his behalf, at the inaugural dinner, he on board R.M.S. *Majestic*, under the chai manship of Col. E. K. Perkins, C.B.E., M. The address contained the following points:

The Minister of Health had piloted to th Statute Book during the past year a Smok Abatement Act, which, if it did little mor had at least drawn general attention to national problem, the solution of which la very largely in our hands. When we remem bered the depressing apathy towards th question only a few years ago, it was mos gratifying to discover two Cabinet Ministe within ten days thinking it worth whil to speak emphatically upon the pressing nee for smoke abatement. It was a very happ privilege that they could make the new house that were springing up, especially the house of the working-classes, smokeless, clean an easier to run by putting gas within the reac of all. It was the best insurance agains future slums, and a great contribution t the housing problem. It was a service t public health, not only in reducing smok and admitting more sunlight to towns, bu in reducing the fatiguing drudgery and end ing the unhealthy conditions of all wh worked and lived in British homes. It wa more even than that. The Minister o Health gave his cordial support last yea to the formation of an admirable body calle the Council for the Preservation of Rur England. It was a great and urgent wor to preserve the beauty of the countryside But five-sixths of the population lived i towns. Could they not reasonably call them selves a Council for the Restoration of Beaut to Urban England? Truly, if smoke went dirt would go: if dirt went, slums would g and if sunlight came in, as it would, th "ugliness of an industrial age" was a phras that would lose its meaning. The Goverr ment proposed to introduce a Factory Bi next session, designed to raise the standar of the more backward factories to the lev which had already been reached by the mo progressive. How far had that standard a vanced? The rate of progress would depen on what they and others could contribu to factory hygiene. It was not without pu pose that they had devoted much researc to the contribution they could make in pr viding gas as an industrial fuel, for wat heating and canteens, for lighting and so o It was at once a human and a commerci argument for gas that where it had becon the fuel of industry, the working conditio had been vastly improved. Hot, heav labour in stoking, clinkering and removir ashes had been ended. Cleanliness had t placed dirt. And, on the other side, g cooking had made possible the factory ca teen. But for the service they had been al to render in those directions, the standar set by the new Factory Bill would be mu lower than in fact they were going to be.

BOOK REVIEWS

Architecture of the Renaissance in France. By W. H. WARD, M.A., R.I.B.A. New Edition, edited and revised, where necessary, by SIR JOHN W. SIMPSON, M.A., P.P.R.I.B.A. 2 vols. (Batsfords.) Illustrated. 21s. each vol. or 2 guineas the set.

fifteen years that have elapsed since t appeared have enhanced rather than ished the value of the late Mr. W. H. 's history of Renaissance architecture ance. Scarcely any special revision was ed for the new edition, partly because new material has come to light since uthor's thorough and accurate study e subject, and also because he had y revised the book shortly before ath. Sir John Simpson makes this clear preface, in which he disclaims, there- a reviser's full share in the recently volumes. It is fortunate, however, that alterations or amplifications as were l after the author's death should have handled by a friend associated with him original preparation of the work, and moreover, whose name is so well ned. The foreign type in which the new n is set produces a feeling of unarity, but would seem to account for the two slight errors noticed. The literary y of the book loses none of its appeal e reader, and the orderly arrangement s reference both easy and pleasant, which always the case with a scholarly history Additional illustrations appear in the dition.

tory is the record of a one-time present n retrospect, often, therefore, in a truer rtion than at close quarters. We our- live in a period of history; therefore, istorical record and detailed examination hitecture and its allied arts and sciences period of political, social, literary and ific change such as that covered by the 1495 to 1830, is both a useful and an alling study, tending towards a better of proportion. The architectural history ance from the end of the fifteenth to iddle of the nineteenth century shows a ion compounded of a consciousness of internal needs, and a susceptibility to influences from without. It was a on in many respects parallel to that in English architecture stands to-day. e was conscious of a new-found national ice and independence; yet she was aneously aware, too, of the possible of wider intercourse, made possible by ed transport conditions, with neighbour s. In her case, as with England to-day, nd peace, trade and travel, contributed uota of points of contact.

in. the architecture of France, when val times were passed, was "mainly and peaceful . . . to house the Royal . . . the nobility, . . . and the middle enriched by the newly established y. The *chateau* and *hotel* would standard, not the church or the It would be the product of inl genius, and freed from the preion of a single structural problem." er, town-planning, civic architecture, design, decoration, theatres, scenery, as occasional monuments and churches, cluded in the purview of the French t then, as they are in that of the t to-day. The equipment of the archi- student then followed in a more field much the same lines as archi- education to-day, though in France architect might have to prepare him- to face religious persecution, or the of Medici queens. In our own time inating motives of building are unly commercial and industrial interests; "housing of peaceful citizens"—the ssion, as Mr. Ward pointed out, of cture proper"—takes up a considerre of attention, and a small but sig- proportion of civic and memorial architecture occurs. A further indication of the similarities between England to-day and France in the Renaissance period is found in the tendency to borrow motifs from foreign sources, ancient and modern, in default of an actual and vigorous native "style." It is no doubt more difficult for the Englishman to keep a grip on the merits of older English forms at the present time, owing to the violence of the Victorian reaction, than it was for the Frenchman to graft his new "foreign" notions on to the stock of his national style, which had so recently fallen into decay. Even the architects under the French Empire had enough national spirit left in them to cope with the "outbreak of sphinxes and pylons" after the Egyptian campaign. It is vitally important to modern English architecture, however, that the best characteristics of national English building should not be lost to sight, in the search for novelty, whether culled from Crete or Chicago. To study anew Mr. Ward's book should help to maintain a just balance between national and international characteristics in architecture. For in the history of Renaissance architecture in France, the processes of assimiliation and creation are seen co-operating to meet fresh problems in an age of change and expansion.

The Painter's Methods and Materials. By PROFESSOR A. P. LAURIE, M.A. (Seeley, Service & Co.)

This is a book by the Professor of Painting at the Royal Academy, a well-known authority on a subject of much importance to painters. Its usefulness can hardly be overrated at a time when studio traditions so little remain, and when the artist has to depend so much on his own resources. While the knowledge acquired through books has to be tested and confirmed by experience, we have in this volume the results of that experience in science and artistry. Professor Laurie, in pursuing the scientific method, in his inquiry into the painter's methods, enables us to learn the reasons of things, such as why one treatment is better than another, one vehicle more safe to employ. The volume includes information extending to a record of the written evidence about early painting and methods—the priming of panels and canvas, pigments, their choice and reliability, the behaviour of white light, methods of fresco, tempera and oil painting, &c.,—with citations from the most reliable sources of the experience of contemporary artists who have practised in the different materials.

On the optical properties of pigments we learn why they are permanent, and it is explained how that white light is in reality composed of different coloured lights, white light being a complex of waves of different wave lengths, and that each wave is refracted at a different angle according to its wave length, producing the different coloured sensations we name red, orange, yellow, green, blue and violet. All colours are, in fact, contained in white light. The author is interesting also on the subject of studio traditions, and claims to have produced sufficient evidence to show that in the fifteenth century, and for some time later, there must have been in existence studio traditions for a correct use of a combined oil and tempera technique. The later method, he would tell us, of solid lights and transparent shadows, so much influencing the technique of the modern painter, has lost grip of fundamental optical principles. The excessive use of linseed oil, and the better practice of reducing the amount by placing on blotting paper for the absorption of the oil beforehand, is explained. It appears to the author as still a matter of debate as to which oil is best for painting, but there can be no doubt that a stiff palette is much better than a sloppy one.

A point of practical interest to the painter is how best to counteract the sinking of the colour during the progress of the picture, whether there are not other means than white of egg, or glazing with the section of a raw potato. G. F. Watts, whose pictures are an example of fine impasto, worked with a stiff palette.

On the question of preference between gesso and oil, as a ground on which to paint, there will be difference of opinion, though in either case it is a matter of fundamental importance. There is no mention by the author of one form of ground which has certainly proved itself of sound character, though we have no knowledge of the scientific explanation, if any, for its use, and that is the mixing of flour paste and zinc white, which is then painted on stiffly over either a gesso or oil ground. Vasari, referring to the use of flour, writes, "When canvas became the fashion, gesso being likely to crack in ceiling, they made a ground of flour (farina), white lead and nut oil, after the canvas had been smoothed by size." Some general conclusions noted by the writer are that linseed oil yellows and darkens with time, and that pigments become more translucent for the same reason. Pigments in tempera are brighter than those in oil. Transparent pigments suffer more degradation in oil than opaque pigments. On the question of the most permanent white, the writer would suggest that this is to be found in the white gesso ground, though there are difficulties in making use of this which will be apparent to any painter. There must usually be a stage in a picture when the conscious subordination to methods is superseded by more imperative requirements; the artist has not only to follow precedents but to make them. This calls for new resources difficult of tabulation in text-books. But it is a nice question to adjust what is due to traditional practice on one side, and to invention and adventure on the other, but the adventure is only justified as the extension of knowledge, not the ignorance of it. It is true the discovery of the artist's needs of realisation transcend all conscious method, and thought and feeling have both to re-think themselves. This is not to deprecate the sound building up of a tradition of practice, such as is adumbrated in this excellent book, but to keep in mind that results lie in advance of all this, and are often a discovery to the artist himself. It is the least part of art that can be learned.

There are useful hints for the painter, such as how to remove mastic varnish which has a tendency to bloom, owing, we believe, to the varnish not being properly warmed before use—this can be done by friction. The difficulty in making use of wood panels lies in their tendency to warp, expand and contract—a difficulty increased in the case of a large panel. It would be instructive to learn from the author what he would recommend; whether five plywood, ledged behind, offers a secure background for a gesso ground. In the author's list of colours cadmium yellow is given as the most doubtful, and in regard to the difficulty of a bright permanent yellow we are told that Holbein made use of gold leaf and yellow ochre to obtain a high point of light in yellow. A method, adopted also by painters to-day, is that of laying-in the picture in terra verte as a good foundation for over-painting. This has a long tradition behind it. The laying-in of the picture in monochrome in the first instance and completing the after-colouring in over-glaze painting was the method adopted, we believe, by Sir J. Reynolds in many of his portraits. But there are more ways than one to Rome, and the way should always be open for further experiment and adventure. None the less we learn from this volume the importance to the student of following the ways of precedent and long experience, and of profiting by all that the past has so laboriously placed at his disposal, and which is so well brought together in this book. When compelled later by the law of his own expression to create new methods, he will thus be sure of his path.

Engineering Abstracts. Published by the Institution of Civil Engineers.

This publication, composed of extracts by eminent engineers from current periodical literature published outside the United Kingdom of engineering and applied science, is one which every progressive engineer should obtain and read. It describes what foreign engineers are doing, what problems they are being faced with, and how they are tackling them. A comprehensive index both of names and subjects is appended.

THE BUILDING TRADE

THE NATIONAL FEDERATION OF HOUSE BUILDERS

The Half-Yearly Meeting and Conference of the National Federation of Housebuilders was held on Thursday and Friday, September 29th and 30th, in the Council Chamber of the Town Hall at Scarborough, where delegates from all over the country attended. The Mayor of Scarborough (Alderman John Bielby, J.P.), in the giving of a civic welcome to the Conference, stated that the Scarborough Corporation had had to tackle the problem of providing municipal houses, but they ran into very grave difficulties when they commenced to build houses by direct labour in 1919. Fifty-six houses were built under this system, when they had to call a halt owing to cost. The Council realised they were only responsible for the penny rate, but they did not see any sense in building houses at a cost of £1,200 each. He would not enter into detail as to where the blame rested, but some blamed the small labour output received. The speaker mentioned that the country had nearly reached the million mark of houses built since the war, and although this was satisfactory it had been done at a very heavy cost to the nation. He also expressed the opinion that subsidisation was unsatisfactory, and the sooner it was withdrawn the better.

Mr. J. W. Comben (London), the President, responded, and thanked the Corporation of Scarborough for placing their Council Chamber at the Federation's disposal. The private housebuilder, he said, regarded municipalities somewhat as partners in the building trade, but he did not know how they liked their new position of landlords. There were Corporations, he believed, who were not appreciating this new role. The housing position of the country, however, was so unsatisfactory that the Federation welcomed any effort by municipalities in solving what was undoubtedly one of the most urgent of our national problems—that of providing houses for the less well paid workers at rents in accordance with their pockets.

Mr. G. Anstee Perks (Long Eaton), Vice-President of the Federation, seconded the response, and said he hoped the time would come even within a few years when the lowering of prices would allow private enterprise again to enter into its former field of providing practically all the houses the country needed.

The Conference then commenced on the subject of "Housing After the Subsidy—Can Houses be Built to Rent?" the President opening the discussion. He pointed out that the Federation was meeting at a critical period in the history of building, for there was not only a reduction in subsidy, but also a reduced selling figure on the houses on which the subsidy could be obtained. Both municipalities and private enterprise were pausing to see what course the building industry was able to take in the near future. Though nearly a million houses had been erected since the war, there was still a cry from hundreds and thousands of worthy citizens for better and healthier housing conditions. The speakers expressed a personal opinion that until the Rent Restriction Acts were removed, the confidence of the investor restored, and the unfair municipal competition in subsidised houses of the villa type withdrawn, there seemed little prospect of private enterprise building houses to let. Municipalities should confine their energies to the type of house intended for the very poor, and not burden the taxpayer with a heavy debt for years to come on the type of house that private enterprise was willing and able to supply. The Federation existed to encourage building houses by private enterprise for purchase by owner occupiers. At the present time they were erecting and selling two out of every three houses being built. The year ended March 31st last was the most progressive year in the history of the country's housing, the enormous total of 217,622 houses being completed. These figures were divided up as follows:—

Houses built in local authorities schemes	74,093
Houses built by private enterprise under subsidy	79,686
Houses built by private enterprise without State assistance	63,850
	217,629

The private builder, therefore, it could be concluded, last year erected 143,000 houses on his own initiative, and of these 122,296 were small houses for the working classes and of the small villa type. The figures represented twice as many as the pre-war private enterprise average. He thought the general figures were a fair division of the labour and duty in housing the people. Because of high prices and limitation of rents, no one but the State could build houses to let, and these at an enormous loss, for the national cost of housing subsidies during the current year would be £9,340,000, not including administrative expenses. Turning to the loan side of housing, the President said that he thought local authorities were beginning to develop the loan clauses of the Small Dwellings Acquisition Acts and Housing Acts. He could not quite account for the fact that local authorities were operating more under the former than the latter; but this might well be that the Small Dwellings Acquisition Act laid down a maximum loaning figure of £1,200 as against £1,500 under the Housing Acts, the effect of this being to keep loan facilities more in respect to smaller houses.

Referring to town planning, the speaker said that, though every movement which would improve the health and comfort of housing must be welcomed, he thought that a word of warning was necessary with regard to the density of houses per acre. This formed an outstanding feature in modern town-planning, and, according to reports, 78 per cent. of the land included in schemes was limited for development at 12 houses to the acre. It was realised that towns of the future should be laid out scientifically and not be allowed to grow haphazardly; but in view of the need at the present time for working-class cottages to be let at an "all-in" rent of, say, 10s. per week, he thought that a density of 12 to the acre would be an impossible ideal, and that 16 or 20 would be a reasonable density. Local authorities had shown by their activities during the last four years that cheap houses for the working classes could not be built at so sparse a density.

Mr. T. R. Day (Manchester) said he thought it could never be expected that any investor would purchase houses with doubtful security, and for this reason he was not contemplating building to rent again. The fact that no one knew what would happen in the future with regard to prices also mitigated against letting schemes.

Mr. A. J. Belton (Sheffield) said too much capital would have been tied up in building to rent, and pointed out that cost of labour which was not likely to fall was one of the chief obstructions. He foresaw little falling in costs.

Mrs. Willson (Halifax), the only member of the Federation, said she sorry for the tone the discussion had t If at the present time it was impo to build to let, she also felt it wa possible for anyone to buy houses. either case someone would have to t some money. She was sure that the culty was found in the unfair compe from corporations. In the majori cases an extra subsidy was obtained the rates, a facility that private prise could not receive. If private prise was presented with the same ties as corporations, the private b would be building houses to let at th sent time.

Mr. A. Waddington (Sheffield) said could be built to let; but in order this could be so, the conditions which exist would have to be definitely It was better for all subsidies to b celled than that there should be pre an unequal and insidious subsidy i form of help from the rates enjoy corporations.

The discussion was adjourned unti Friday morning

An informal dinner, at which the of Scarborough was present, was he the Grand Hotel on Thursday evening.

Discussion on the former day's s was resumed on Friday morning, a the motion of Mr. J. H. B. Dixon, President (Birmingham), seconded by A. J. Belton (Sheffield), the foll resolution was unanimously passed:—

"This meeting of the National F tion of House Builders urges the Mi of Health to consider what steps c taken to put into effect the clause emb in the Ministry Circular 755, dated ary 1, 1927, that 'in schemes by the Authority themselves the Local Auth should avoid as far as possible the tion of the larger and more expensive of house, and should devote themselv the provision of a type of house whi most readily capable with the aid o subsidy available of being let at within the means of the less well workers,' and further in particul take action in strongly advising Authorities to ensure that such hous let to the actual class of tenant for they are intended to provide."

Mr. F. J. C. Ingram (London) then duced a paper on the "Taxation of U Ground Rents," to which the Conf gave a hearty reception.

The Assistant Secretary, Mr. W Dudley (London) opened a discussio "Building Society Loans." The w recent years by building societies, he was deserving of highest praise, as the educated the public to solve their h problem by the one satisfactory and lent method of owner-occupiership, ar also weaned the public from the vi renting as the only alternative in pro proper accommodation. He thought ever, there were one or two matters needed a little ventilation and urged ing societies, if possible, to use a rea amount of elasticity in respect to se and advances. If building societies maintain the owner-occupier systen continue the vast business they ha sacted during recent years, it would b sary to tap the potential market w people with small deposits might bu own houses. Reference was made to a of guarantee policies issued by in companies so that 90 per cent. a might be made. This system, howe tailed more initial outlay, as a purch to pay a premium of 10 per cent amount representing the difference the 90 per cent. and an ordinary

ety advance. Where such a guarantee in existence it was regrettable that a chaser was made to pay out on an amount resented by the difference between a 66 two-thirds and the 90 per cent. advance. suggested that the treating of a 75 per t. advance should be adopted as being patible with the small risk taken. Obration was also made on the method emred over repayment periods by the fact t the longer the period, the less was the ance. A system whereby a 90 per cent. ance could be obtained over a 20-year iod would be of very material assistance sustaining the principle of owner-occupier-p, and together would not make for inicient financial security.

Mr. A. J. Belton (Sheffield) stated that le he agreed that such assistance was essary, it was a fact that building socis were lessening their facilities, and he sonally looked upon the matter with some rm The question should be watched in interest of the country's housing gener-.

Mrs. Willson (Halifax) agreed that it was st difficult at the present time to obtain itable terms from building societies, and gested that house builders should turn ir attention to taking full advantage of powers conferred on local authorities der the Small Dwellings Acquisition Act, developing this side of mortgage repayents. prospective purchasers would be more nomically and conveniently served.

After discussion on rating and assessments, vote of thanks was proposed by Mr. C. G. Ward (Nottingham) to the Corporation of arborough for the use of the Council hamber, which was seconded by Mr. A. ord (Birmingham).

The Conference closed with a vote of anks to the President, proposed by Mr. . E. Savage (Nottingham), and seconded Mr. A. B. Cutler (London).

THE ANNUAL REPORT OF THE MINISTRY OF HEALTH

The eighth Annual Report of the Ministry of Health, which has recently been issued, differs from its predecessors in three particulars. First, it includes by way of introduction a retrospect of the principal changes in the organisation and development of services within the purview of the Ministry since the Ministry of Health was first established by the Ministry of Health Act, 1919. Secondly, the order in which services fall under the main head of Public Health has been substantially changed, and thirdly, reports by the General Inspectors on the administration of the Poor Law are included, which it is stated is a revival of a former practice. The scope of this Report is too wide to allow us to attempt any notice of it in detail, but we first turn to the question of House Production. In the introductory retrospect we find it stated that in the five years before the war the average annual increase in the number of houses was 61,000; we here get a unit for the purposes of comparison as to progress, but an actual comparison, year by year, cannot be made until the year 1924, for as regards houses erected without State assistance detailed figures are not available for the years 1920-23, and the number is only estimated in one figure, viz., 53,800.

Taking the period 1924-1927, the figures are as under:—

	With State assistance.	Without State assistance.	Total.
1924 ...	18,664	67,546	86,210
1925 ...	67,669	69,220	136,889
1926 ...	106,987	66,439	173,426
1927 ...	153,779	63,850	217,629

It will be seen from these figures that the number of houses erected without State assistance in each of the above years has remained fairly uniform, and not very much in excess of the average for the five years before the war. It is State aid which has enabled the shortage of houses gradually to be overtaken, and which, in 1927, practically produced some 151,000 houses above the pre-war rate of supply. The Report in this introductory section states that this effort has cost the Exchequer nearly £54 millions, but that over £42 millions of this has been paid under the Act of 1919. In the current year (1927-8) housing subsidies amount to £9,340,000, and account for nearly half of the whole expenditure for which provision is made in the estimates of the Ministry of Health.

Turning now to the body of the Report, we find that the number of houses built since the Armistice is: (1) With State assistance, 545,000; (2) without State assistance, including 30,000 which it is estimated were erected from the Armistice to October, 1922, 321,000, making a total of 866,000 houses. It is important, however, to note that of the 321,000 houses built without State assistance, approximately 231,000 were not of more than £26 rateable value, or £35 rateable value in the Metropolitan Police District. It is often alleged that provision of houses of lower values has been neglected, and that the figures relate to houses of high value not intended for any but the wealthy classes, so the above figures contravert this allegation. The next table of special interest is that which relates to the proportion of houses shown to have been built in the four years in the above table erected respectively by private enterprise and by local authorities:—

	Houses built by Private Enterprise.		Houses built by Local Authorities with State assistance.	Total
	With State assistance	Without State assistance.		
1923-4	4,311	67,546	14,353	86,210
1924-5	47,045	69,220	20,624	136,889
1925-6	62,769	66,439	44,218	173,426
1926-7	79,686	63,850	74,093	217,629

From this table we can add to the observation we made in reference to the first table that it is private enterprise which, without State aid, produces at the present time about 2,850 more houses than were produced on the average in the yearly pre-war period.

We will now turn to the table relating to payments of Exchequer subsidy. Since the war these payments have been:—

Under the Housing Town Planning Act, 1919	£42,398,960
Under the Housing (Additional Powers) Act, 1919	£9,493,155
Under the Housing Act, 1923 ...	£1,490,572
Under the Housing (Financial Provisions) Act, 1924 ...	£565,004
Demonstration Houses	£26,000
Grants towards cottages for tuberculous ex-Service men	£20,000
Total	£53,993,691

During the year under review the total amount of subsidy paid was as under:—

Under the Housing, etc., Act, 1919	£6,938,178
Under the Housing Act, 1923...	£948,254
Under the Housing Act, 1924...	£474,436
Demonstration Houses	£12,000
Grants towards Cottages for tuberculosis ex-Service men	£3,080
Total	£8,375,948

The estimates for the year 1927-8 show an increase upon the above figure of £853,000. These commitments will continue, as is well known, for periods of 20

and 40 years in respect of houses completed before October 1st this year, but in respect of houses erected after that date some relief will be effected by the draft Order made under Section 5 of the Housing Act, 1924, on December 11th, 1926, which reduces the Exchequer grants of £6 for 20 years in respect of houses not subject to the special conditions as to rents, etc., prescribed by Sect. 3 of the Act of 1924, to £4. The grant of £9 for 40 years in respect of houses subject to the special conditions and situated in a non-agricultural parish, to £7 10s., and the £12 10s. for 40 years in respect of houses subject to the special conditions and situated in an agricultural parish to £11. Therefore, from October 1st next there will be a reduction in the subsidy per house built after that date, but, of course, the actual annual amount paid in subsidies will depend upon the number of subsidised houses which may be erected.

From the tables we have given above it is apparent that the houses built without subsidy have been those erected by private enterprise, and that the number so erected has remained fairly stationary at a little above the level of the average of the five years preceding the war; and it is also shown that the commitments in subsidies amounts at present to an annual sum of between £8 and £9 millions. These commitments, although on a less scale, are being continued for further periods of 20 and 40 years, and thus housing is subsidised for years to come at the cost of the taxpayer, though little is thought of this direct contribution to what is intended to be the housing of the working classes. A subsidy of about £20 millions for eight months to the mining industry aroused the public attention, but the housing subsidies pass almost unnoticed.

It must be a serious question how the problem of housing can ever return to normal conditions—that is to say, how the needs of the population can be satisfied either by private enterprise, or by the local authorities building houses out of loans which can be paid off out of the rents received, leaving those rents on an economic basis. The above figures show that private enterprise unassisted is still alive and providing more houses than the pre-war level, and between one-third and one-fourth of the houses erected in the year 1926-7, and we think it must be apparent that it is to private enterprise that the nation must look to relieve it from the present situation. What has been done to stimulate private enterprise? The 1924 Act by itself distinctly prejudiced it, and the subsequent Acts have left it only on an equality with other agencies. The Rent Restriction Acts, although not affecting houses now being built, have seriously shaken the public confidence in investment in house property, much of which is held to this day under restrictions grievous to be borne, and no indication has yet been given when those shackles will be removed. It is recognised under the present economic system of this country that no subsidised industry can be a sound industry, and that if it can only continue under such conditions it must be closed down, and steps should certainly be taken to place housing once again on a sound economic basis. To secure this we think the figures given in this Report conclusively show that private enterprise must be looked to, and that private enterprise, far from being repressed by war legislation still continued, should be offered every possible encouragement to embark capital and labour on house property. With apologies for this digression we return to the Report.

As regards houses in agricultural parishes, it is stated that general statistics are not available, but under the Housing (Financial Provisions) Act, 1924, which provided for an additional subsidy for houses subject to special conditions, schemes had been submitted by 250 local authorities in respect of 10,194 houses, of which 4,313 had been completed at March 31st, 1927.

A table of interest is that which shows the quarterly average price of houses included in contracts, let by, or in, direct labour schemes of, local authorities:—

March	425	490

Loans by Local Authorities.

Apart from subsidies there is the assistance towards house building afforded by local authorities by way of loans and guarantees, as to which the Report affords the following information. The increased extent to which advantage has been taken of this form of assistance is shown in the following table:—

1923-4	£3,227,496
1924-5	£8,296,299
1926-7	£14,287,495

During the year guarantees were given to building societies by 63 local authorities for repayment of advances in respect of 3,474 houses.

Labour and Materials.

As regards the supply of labour, it is satisfactory to note that the Report states that returns received from the local authorities show that the total number of building trade apprentices taken on in connection with contracts under local authorities' housing schemes from the date of the inception of the Building Industry Committee's scheme, February 3rd, 1925, amounted on January 31st, 1927, to 20,252, as against 8,264 on January 31st, 1926. In general, the Report states, there has been no difficulty in obtaining supplies of materials for the erection of working-class cottages by local authorities, and there has been no necessity for the Building Materials Supply Committee to meet recently.

Unhealthy Areas.

Next to creation of new houses comes the question of unhealthy areas, and the Report states that between 1919 and March 31st, 1927, 78 local authorities submitted 104 schemes for the improvement of insanitary areas, and of these schemes 85, involving the demolition of 11,227 houses and other buildings, had been confirmed by March 31st, 1926.

Under the Housing Act, 1925, Parts I. and II., 2,287 Closing Orders were made: 443 were determined after houses were made fit, and 678 houses were demolished in pursuance of Demolition Orders.

These annual reports contain a mass of information of interest, but in the present notice we have been unable to touch upon but a few subjects, and we must close it with a reference to by-laws in relation to new streets and buildings, a subject which has recently been considered at some length in our columns.

By-Laws.

In the last Report of the Ministry it was shown that since the beginning of 1923 up to the commencement of the year 1926 some 700 local authorities had undertaken a revision of their by-laws, and a hope was expressed that in the Report of this year it would be possible to state that few, if any, districts would remain where modern methods of constructing buildings and laying out streets would be obstructed or penalised by by-laws. The present Report states that this hope has been fulfilled; the number of series of new by-laws confirmed in t calendar year 1926 was 380, and in the fi quarter of this year 66 have been confirme and almost all the by-laws thus confirm take the place of more restrictive by-la On March 31st, 48 series were known to in the printer's hands or on deposit f public inspection, and thus but 27 loc authorities were left with this work u completed, and most of these 27 authorit had proposals in advanced stages.

This process of revision was pointed o to be one of the advantages attending t by-law system in the Report of the Depa mental Committee on Building By-laws, an as we showed in our recent articles, t Committee recommended all control shoul so far as possible, take the form of by-law The process of revision may be said to ha been taken seriously in hand since the ye 1912, and the present Report of the Minist points out that some modification may required, in the light of recent experienc in the by-laws revised between 1912 and th circular issued by the Ministry in 192 since more than 1,100 local authorities ha brought their by-laws up-to-date since th issue of this last circular. The Minist therefore hope, in the course of the comi year, to examine the series made betwe 1912 and 1922, and to communicate wit the local authorities where definite improv ments appear desirable.

Repeal of Local Acts.

The co-ordination of the by-law syste necessitates the repeal and amendment local Acts, and the Report gives particula of the progress made in this direction, an the results may be summarised in the fo lowing passage from the Report. "Ther are now apparently not more than six area in which provisions of Local Acts hav been kept in force which are likely t interfere with modern methods of buildin or the making of by-laws of a modern type. From a paragraph under the heading "By laws," it appears the statement, however, ap plies to districts outside London.

ELECTRICAL CONTRACTING INDUSTR

Variation of Wages.

In accordance with the National Wage Agreements entered into by the Nation Federated Electrical Association and Electr cal Trades Union under dates August 7, 192 and September 22, 1921, it has been decide that the variation in cost of living justifi a 28½ per cent. reduction in the basic rat of wages (April, 1921), and that the ne hourly reductions and rates of pay applicab to the respective grades of the agreement a as follows :—

	Basic Rate.	Present Rate.	Reduction from present Rate.	New Rate.
Grade A ...	2/6	... 1/9¾	... ¼d.	... 1/9½
Grade B ...	2/3	... 1/7½	... ¼d.	... 1/7¼
Grade C ...	2/1	... 1/6¼	... ¼d.	... 1/6
Grade D ...	1/11	... 1/4¾	... ¼d	... 1/4½

* This rate includes a travelling allowance. No furt allowances to be paid except as provided by Rule 9 the London Rules dated February, 1920.

The above rates will come into effect the second pay day in October, 1927, for t period covered by that pay day, and v remain current up to and including the per covered by the first pay day in Februa 1928.

Electricity Scheme: System of Supply London and S.E. England.

The Central Electricity Board have iss their plans for the transformation of system of electricity supply for London South-East England. Fourteen counties included in the scheme, which in the cou of a few years will reduce the 152 generat stations in the area to 18 capital stati only, the others being used as converting distributing centres. The scheme, it understood, will be largely completed 1933-34, and the capital expenditure invol is estimated at £12,344,000.

(For rates of wages in the Building Trade in Scotland see page 563.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed, that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or plac where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A Copy will be sent by return, and your Remittance refunded if the Book does : : not satisfy your requirements : :

RMOUTH.—General Purposes Committee are to le more accommodation on North Denes site 0; F. R. B. Haward to be architect and prepare

RK.—City Council decided to erect another 110 on Tang Hall housing estate.

TRADE NEWS

Concrete Mixers.

Messrs. Ransomes & Rapier, Ltd., of Waterside Ironworks, Ipswich, have issued a folder in which are described concisely their tilting drum and rotary drum types of "Ransome" concrete mixers. These types of mixer—electric, petrol, paraffin, or steam-driven—are, we believe, most efficient in use, and capable of being run at a low cost. We learn also that a substantial reduction in the prices of all models has been effected.

An Asbestos Dividend.

The directors of Bell's United Asbestos Co., Ltd., have declared an interim dividend on the old ordinary shares Nos. 1 to 140,000 and Nos. 200,001 to 353,532 of 1s. per share, being 5 per cent. (actual), less income-tax, on account of the current year. The dividend will be paid on the 17th inst. to shareholders on the register on October 3, and the ordinary share transfer books are closed to the 15th.

Automatic Lifts.

We are informed as follows regarding the new "Truelevel" control gear which Messrs. Smith, Major & Stevens, Ltd., proprietors of the "S.M.S." elevators, have fitted to their lifts:—This new gear ensures that the lift stops accurately at floor level. It performs this duty automatically and irrespective of the skill of the attendant (if any) or weight of load. Now that efficient and economical stopping gears are available, it is reasonable to suppose that in the near future every lift will stop level with the alighting floor, and that the much-used warning, "mind the step, please," will pass into the limbo of unnecessary remarks.

Lorries for Contractors.

For more than three years, we learn, the Dennis 30-cwt. chassis has been in production. Thoroughly tested by severe treatment both in this country and overseas, it is known for a thoroughly dependable vehicle. Its carrying capacity classes it as the "happy medium" between a heavy lorry and what might be described as an over-grown private car chassis; it possesses the speed and easy riding of the latter combined with the rugged durability of the former. The ever-increasing demand for this machine has steadily raised the rate of production; this in turn has necessitated greater manufacturing facilities, and reduced, accordingly, the cost. In consequence, the chassis can now be sold at a very much lower price, and this is broadcast in the firm's announcement in our advertisement pages.

A Handbook on Cars.

The current issue of the *Autocar* (dated October 7) contains the Annual Buyers' Guide, a feature which is always appreciated in view of the approaching motor exhibition at Olympia. This guide is intended to help purchasers in their selection of a new car, and it gives alphabetically arranged tables of all the cars, both British and imported, that will be on the British market for 1928, with full specification, principal measurements, annual tax, and weight of every car, together with the prices of chassis, open tourer, and saloon models.

Constructional Steelwork.

We are given to understand that Messrs. Archibald Dawnay & Sons, Ltd., of Battersea, have now purchased the extensive structural engineering works and equipment of Sir William Arrol & Co. (Swansea), Ltd., at King's Docks, Swansea. The acquirement of these works, in addition to those already existing at Battersea, Welwyn Garden City, Cardiff, and Norwich, will enable them very greatly to increase their capacity for the rapid fabrication of all classes of constructional steelwork for buildings of every description, factories, office blocks, mill buildings, hangars, cinemas, theatres, bridgework, warehouses, dock shed, power houses, etc.

NEW BUILDINGS IN LONDON

Bermondsey.—Mission.—A medical mission is to be built on a site at the rear of 44, Grange-road, abutting upon Crimscott-street. The plans have been prepared by Mr. H. G. Cherry, F.R.I.B.A., 7, Buckingham-street, W.C.2, and the work is for the London County Council.

Camberwell.—Extensions.—Messrs. Glover, Webb & Liversidge are enlarging their coach-building and painting shops in Old Kent-road. Messrs. Young & Co., of 6, Queen Anne's-gate, Westminster, are supplying the constructional steelwork. Mr. Reginald Lone, A.R.I.B.A., 63, Lincoln's Inn-fields, is the architect.

Eltham.—Houses.—Messrs. Eley and Allen, of 83, Powis-street, Woolwich, are the architects for the 51 houses that are to be erected on a new road between Southwood-road and Sidcup-road, Eltham.

Gray's Inn.—Library.—A site is being cleared in South-square for the Gray's Inn Library extension, which will cost about £40,000. The new building is being designed by Sir Edwin Cooper, of 3, Verulam-buildings, W.C.1.

Lambeth.—Buildings.—For the proposed new buildings which are to be erected in York-road, S.E.1, for the General Lying-in Hospital, the committee are appealing for £30,000, which is the estimated cost of the work. The plans have been prepared by the hospital's own architect. No building contract has yet been let.

London.—Generating Stations.—In connection with the report issued by the Central Electrical board for the electricity supply of South-East England and the whole of London, the board have selected for enlargement the following London generating stations:—Barking, Brimsdown (Middlesex), Deptford East, Deptford West, Hackney, Grove-road (Marylebone), Stepney, Willesden, Bow, Bankside (Southwark) and West Ham.

Merton.—Exchange.—The Merton and Morden Urban District Council have received a letter from the London Telephone Service stating it is intended to open an additional exchange in the Merton district.

North Woolwich.—Rebuilding.—A scheme is now being considered by the Woolwich Council for the rebuilding of the North Woolwich Library.

Plumstead.—Museum.—On a vacant site at the rear of the Plumstead Library, the Woolwich Borough Council are to erect a nature study museum, and also lay out the ground as a botanical and nature study garden.

Reigate.—Houses.—The tender of Messrs. Arthur Cole, Ltd., of Luton, has been accepted by the Reigate Town Council for the erection of 26 parlour-type houses in Smokelane. The plans for the houses have been prepared by Mr. F. T. Clayton, Borough Surveyor. The accepted tender is estimated at £14,310.

Westbourne-grove.—Hall.—An appeal is being made by the Westbourne Park Church for funds to erect a building in memory of the late Dr. John Clifford. A site for the memorial is available on land which adjoins the church, and it is proposed to erect a building which will provide a lecture hall and class-rooms for religious and educational work.

Woolwich. — Houses. — The Woolwich Borough Council are to erect 256 houses on the Eltham housing estate.

Building Contracts.

With regard to the article on this subject which appeared on page 515 of last week's issue, the word in the fourth paragraph in inverted commas should be "novation" not "revolution," and in the third line of column 2 the word "recession" is a misprint for "recission."

RITISH STANDARD SPECIFICATIONS FOR PAINTS ND PAINTING MATERIALS

he British Engineering Standards Associa- has just issued British Standard Specifi- ons for ready mixed linseed oil paint (oil si), green, black and red oxide of iron, pone oil paste for paints, red oxide of iron aste (class 1, natural or mixed oxides) aints and (class 2, oxide of iron base) for ts. They contain clauses regulating the osition together with standard reception . for the purchase of these materials to- er with appendices giving methods of ing out the tests.

ese specifications have been prepared at request of the paint manufacturers by a mittee representative of both the buying manufacturing interests, and as in the of all British Standard Specifications, will be reviewed as experience of their ing or progress in the industry renders cessary, and revised issues will be pub- d from time to time. Amongst other fications in hand which will be pub- i as completed are the following :—Purple es of Iron, Paste Driers, Japan Gold Size, e. Ultramarine Blue, Umber, Sienna, Setting Red Lead, Black Oxide of Iron, Oil Pastes, Indian Reds, Brunswick rome Greens.

pies of these six new specifications (Nos. 95. 297-299-1927) can be obtained from B.E.S.A. Publications Department, 28, ria-street, London, S.W.1, price 2s. 2d. post free.

The Site of Nottingham Goose Fair.

spite of strenuous opposition the Not- m City Council has approved a scheme e erection of a new covered market, at t of nearly £48,000. This will mean moval not only of stalls from the exist- larket Square, but of the historic Goose which dates back for more than seven ies.

THE SCOTTISH BUILDER

SCOTTISH ARCHITECTURAL CRAFTSMEN'S SOCIETY

Mr. James Leitch, president of the Architectural Craftsmen's Society, delivered his presidential address, "John Ruskin on Beauty," at the opening meeting for the session in the Royal Technical College, Glasgow. Mr. Leitch dealt with the subject under the headings, beauty in general, beauty in architecture, what is and what is not ornament in architecture, the right place for ornament, proportion, and abstraction, colour in architecture, and the importance of the roof. The address was based upon John Ruskin's views on beauty. A series of lectures will be given during the winter on architectural subjects.

NEW BUILDINGS IN SCOTLAND

Dundee.—BUILDINGS.—Plans and sections of the following new buildings have been lodged at the Office of the City Engineer :—Arthurstone-terrace—cinema for Mr. J. Bell. Messrs. Allan & Friskin, architects, 26, Castle-street; Clepington-road—factory for the North British Linoleum Co., Ltd.; Ellengowan-drive—garages for Messrs. J. & E. Shepherd, Mr. W. B. D. Keith, architect, 10, Whitehall-street.

Dundee.—SCHOOL.—The Housing Committee are to grant a site for a new school at Craigiebank to the E.C.

Glasgow.—REPAIRS.—The Glasgow Corporation Sub-Committee on Churches and Halls recommend that repairs be carried out to Parkhead Public Hall. It is understood that the scheme will cost at least £1,500.

Aberdeen.—ELECTRICAL WORK.—The Electricity Committee of the Aberdeen Town Council have recommended the Council to apply to the Electricity Commissioners for additional powers to borrow a sum of £191,000 to cover the installation during the next three years of electrical main service

Pitlochry.—HOUSES.—The Perthshire Highland District Committee approved the recommendation that six more houses be built in Pitlochry.

Clydebank.—WAR MEMORIAL.—The Clydebank War Memorial Committee has agreed to recommend to the Town Council that the memorial should take the form of an installation in the tower of the municipal buildings of a clock and chimes.

Dumbarton.—HOUSING.—The Dumbarton County Council have agreed to take immediate steps for compulsory acquiring ground at Dillichip, Bonhill, and at Millburn and the football ground, Renton, for the purpose of providing additional houses.

Seton Castle, Haddington.

At a recent meeting of the Western District Committee at Haddington, it was stated that the ancient castle of Seton, which has been taken over as an ancient monument, constituted a road danger. A suggestion was made that the projection should be taken down and rebuilt, but Lord Polwarth said it would hardly do to rebuild an ancient monument. Mr. Hugh Miller, West Fortune, said that the safety of the public should come first. A sub-committee was appointed to consider several dangerous corners on the mid road between Prestonpans and Ballencrieff.

Eastbourne Church Destroyed.

All Saints' Church, Eastbourne, has been almost destroyed by a fire. The damage is estimated at £40,000. The tower at the east end of the church was saved. All Saints' Church was consecrated in 1879, and was built of stone in the Gothic style.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers—Masons', Bricklayers', Plasterers'.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

OL. CXXXIII. No. 4419. OCTOBER 14, 1927.

CITY DEVELOPMENT AND PRESERVATION.

THE visit of the Town Planning Institute to the cities of Winchester and Southampton for this year's "country meeting" focuses attention on three urgent problems—first, the exercise of control on necessary and inevitable industrial growth; secondly, he problem of communications by sea, rail and road; and, hirdly, the urgent question of the preservation of features of atural beauty or architectural importance.

Winchester, with its venerable origin, wrapped up in the raditional history of England from the earliest times, its amous school and its cathedral of unique beauty, stands for ll those things which the majority of Englishmen would wish t all costs to preserve. And the city has, up to the present ime, suffered far less than most ancient centres of population rom the devastating influence of industrial development; it s also fortunate in having among its chief citizens men who ppreciate the treasures handed down to them by their fore-athers, and who devote their knowledge and ability to preserving he amenities and character of their city.

Southampton, on the other hand, seems to be less fortunate, nd the requirements of commerce have already greatly changed he character of the city, though much has been done of recent ears which is worthy of special commendation. It does not eem to be so well appreciated that, to be effective, town planning nust comprise a survey of and result in a definite source of evelopment for all the factors of expansion and growth, and ot be confined to one part of a city.

The various sections of industrial and commercial activity, uch as the great docks, are, without doubt, triumphs of the kilful use of natural advantages, and every factor which can dd to their efficiency and convenience has been considered. ew developments, new docks, new railway sidings, and new oads are now being considered, but we have considerable oubts as to whether the direct and indirect effect of this xpansion on the district as a whole has been considered with qual attention.

Yet this district is one of the most beautiful in England, nd we feel that if the danger of haphazard industrial growth ere fully realised the weight of public opinion would be fficient to ensure the same measure of protection to the spoiled countryside with its small towns and villages, as is w being applied to the somewhat similar problem in East ent and other districts.

If we consider only the probable results of any considerable dition to Southampton Docks—perfectly reasonable and sirable as this is in the national interest—we see that this st entail a need for new communications and housing, new erial roads, additional railways and sidings, and a large dition to the built-up areas that accommodate an increased mber of workers of all classes. Will these houses stretch like tentacles, as they do in places, in the direction of inland towns and villages? Will the main roads passing ough Winchester and elsewhere become so congested that demand for increased width will become insistent? Will se increased traffic and transport facilities encourage the elopment of industrial areas and thus complete the devasta-n of a whole district?

hese are some of the questions which must occur to those took part in the visits and excursions of the meeting, and as no doubt in order to focus attention on this problem that Town Planning Institute selected Winchester as a centre organised excursions and visits to the various parts of the district in place of the more usual series of papers and discussions.

In Winchester we see chiefly the problem of preservation, not merely the comparatively simple course of the actual preservation of existing buildings, but the more subtle business of conserving the essential character of a historic city, both in the old buildings (by preventing as far as possible their mutilation) and by ensuring that new buildings shall conform to a certain standard and be in harmony with 'ocal traditions and character.

This is an aim which it is not at all easy to realise, and which eventually rests on the rather insecure basis of public opinion; but the excellent housing scheme recently carried out by the Corporation at Stanmore affords a reasonable ground for anticipation that the need for control is realised and that it is accepted as a desirable thing by the majority of the citizens.

At Southampton and in its immediate district the problem is chiefly that ot expansion and development: the need is for a clearer realisation that in such a case it is equally important to apply the principles of foresight and experience to the co-ordination of various factors into a logical and well-ordered scheme, somewhat loosely called "Town Planning," to both land and sea over a sufficiently large area to ensure that the maximum of efficiency is secured without destroying the natural beauties of the countryside or the individual charm of smaller towns and villages.

That this is not an impossibility has been demonstrated by the growing importance attached to the larger view of "town planning" by the big industrial centres in the North, where in many districts local authorities have combined to study their problems by the method of regional surveys, reports and joint town planning committees. That it is a sound business proposition is now generally recognised, and that it is an urgent need for a district of such unlimited possibilities as Southampton, both for the best and the worst development, will, we think, be admitted.

The happy results which have followed the previous country meetings of the Town Planning Institute lead us to hope that, even if the course we have suggested is not immediately contemplated by the County of Southampton (or Hampshire), those in authority may seriously consider whether the moment is not opportune for a detailed and comprehensive survey of the joint problems of preservation and development for the whole region.

The meeting of the Institute was an exceptionally interesting and successful one, and will be remembered by those who took part, not only because ot the fine weather which prevailed, but because of the welcome the members received both at Winchester and Southampton. The chars-a-banc excursion on Sunday to some parts of the New Forest afforded an opportunity of seeing Beaulieu Manor House, where the members were received by Lord Montagu, and of the church and abbey remains, but time did not permit of a visit to the interesting churches in the New Forest, some sketches of which we give on pages 568-9, and in our report of the conference. It will be observed that no special conference meeting was held at which set papers were read, but this did not interfere with the interchange of opinion between the members themselves and between the members and prominent citizens of both Winchester and Southampton, which must always be productive of good where expert advice is needed, and where leading citizens are glad to have it. Most of our towns and cities need such advice, at the present time, and it is fortunate that a belief in this need is rapidly gaining ground.

NOTES

Restoration.

The many criticisms which have been directed against modern restoration of old buildings are recalled by the interesting notes on Oxford by Sir Charles Mallet in *The Times*. He says, "If Sir Gilbert Scott was accused of being overbold in restoration, Mr. Butterfield exceeded all competitors in his readiness to substitute new colours and new methods for the style and standards of the past. . . . In 1861 the venerable college of Merton carried resolutions agreeing to the entire demolition, if need be, of Mob Quadrangle and of the lovely old library above it in order that Mr. Butterfield might have more space for his designs."

Changing Values.

Butterfield's chapel at Balliol has been called a poem in stone. His Keble College was declared in the *Spectator* (1876) to be one of the most beautiful structures of modern England. The *World* wrote of its "unspeakable ugliness" and we are all aware that work is not always fairly or adequately judged during the period when it is created, but assuredly the Gothic revival owed little of its quality to Butterfield. Sir Charles awards well-merited appreciation to the work of Basil Champneys, Bodley and Garner and T. G. Jackson, and we think it is timely and helpful appreciation, for we are too apt to take all our benefits for granted and the work of our best men is often very unfairly belittled and forgotten. Oxford is fortunate in the carrying forward of the style and tradition of its beautiful old buildings by modern architects, such as those above named. It is impossible to over-estimate the value to Oxford of the distinguished services which have been rendered to the city by certain architects. We have sometimes wondered how far association and environment account for the things we do. It is, perhaps, possible to think that at a later time and with different influences, the work of Butterfield might have been such as to command a greater esteem. In conversation with him one could never be in doubt that he was enthusiastic and sincere.

Bramshaw Church.

Collapsing Buildings.

The collapse of buildings on newly opened sites has caused much uneasiness and will, doubtless, lead to increased vigilance. Meantime the following report in *The Times* of what transpired at the last meeting of the London County Council may be read with interest: "Mr. J. D. Gilbert asked the chairman of the Building Acts Committee whether he could make any statement as to the collapse of buildings in Cornhill and Beak Street; were the Council's officers consulted in any way; whether the Council had any power or authority with regard to the reconstruction of old buildings, and, if so, did it give consent in the cases cited and had the committee taken any steps to prevent further accidents of such a nature? Mr. R. I. Tasker replied that the Council's officers were preparing a report, which would be submitted in due course. The Council's officers were not consulted. The Council had power only in cases where relaxations from the London Building Acts were desired. The district surveyor was the statutory officer for securing compliances with the building laws. The consent of the Council was not required as regards foundations in either case. The question of prevention would be dealt with in the report being prepared."

By permission of Messrs. B. T. Batsford.

Ordnance Surveys.

The visit last week of the Town-Planning Institute to the Ordnance Survey Office at Southampton afforded an opportunity of seeing something of the important and useful work carried out by the Department. The whole process of map-making was described and some of the actual work was seen in operation, which made the visit of special interest and value. There never was a time when the usefulness of accurate and easily read maps was more obvious, not only to the users of motor-cars, but to town and municipal authorities, and the maps which are now produced appear to meet all requirements, though we believe a map on the scale of three inches to the mile would be welcome to town planners and others. It may be of interest to mention that Great Britain is the only country in the world whose antiquities are systematically marked on the Government maps. Since the eighteenth century, when theOrdnance Survey was founded, sites and objects of archæological interest have been systematically marked on the maps produced by the Department. From time to time special publications dealing with archæology have been issued. This work is still proceeding; fresh discoveries are instantly being recorded; descriptions of antiquities are corrected in the light of modern research; and an important series of monographs on archæological objects is being published.

Ancient Lights.

Many architects will be interested in reading an able article on "Easements," more particularly Light and Air, by Mr. W. E. Watson, which appears in the current issue of the R.I.B.A. Journal. The writer emphasises several points of importance. One is with regard to a special purpose for which light may be required, as in the fineness of a watchmaker or an artist. Mr. Watson summarises the present state of law in stating that "consideration may be given to a claim for more than the ordinary amount of light, provided it has been enjoyed for upwards of twenty years, and provided further that the owner of the servient tenement had knowledge of this extraordinary user." The burden of proof that the servient owner had such knowledge rests, of course, upon the dominant owner who claims relief. Evidence must also be available as to the exact sizes and position of the windows in a dominant tenement after the same has been pulled down and rebuilt. Measured drawings attested by careful surveyors afford more accurate proofs than photographs. Plans certified by a District Surveyor are of little efficacy, since the Building Act empowers him to certify only the extent of buildings, not the positions of windows in them.

Cheap Cottages and Bungalows.

The public is certainly awakening to the reality of the danger which is invading the beauty of our countryside, and we find an echo of the fact in the excellent paper by Mr. E. C. Cholmondeley at the Church Congress last week, in which he referred to the wide inroads being made into the amenities of the country by displeasing building operations. He said "The kindly face of the old countryside was being pimpled with a disfiguring rash of regrettable architecture—bungalows and 'bijou' residences. The charabanc and the secondary school were suburbanising large tracts of rural England." The misfortune is, of course, that we have begun our salvation crusade too late. Some delightful parts of the country are already almost completely spoiled, and the irony of it, to the really good designer of houses and the well-equipped town-planner, is that it is to a great extent unnecessary. If we must have cottages in prominent positions in the suburbs and in and about charming old villages, we might at least have them so designed as not to be veritable eyesores. But we could name instances in which well-meant and gratuitous advice has been completely ignored.

Detail of Fresco, the Great Hall, Lincoln's Inn.
By G. F. Watts.

New Forest Churches.

We give on this and the opposite page and also on pages 585-587 some sketches of New Forest churches by Mr. T. Raffles Davison, which are of topical interest in view of the recent Winchester Conference of the Town Planning Institute, a report of which is given in this issue. These old churches are happily very much better known to-day than they were a few years ago, though they are not so frequently visted by those who pass through the New Forest as their interest and charm really merit.

The Trades' Training School.

The valuable work done by the Trades' Training Schools, Great Tichfield Street, was referred to in the speeches made at the presentation of prizes to students at the Carpenters' Hall last Monday, a report of which we publish on page 591. Sir Robert Blair delivered an address on technical training in London, and Sir Banister Fletcher, director of the Schools, made some well-timed observations, especially in regard to the use of machinery. "The machine," said Sir Banister, "was the product of human intelligence and was not itself intelligent; so when adaptability to special detail was required, they must always have resort to handwork, which was directed by the intelligent brain of the actual worker. Thus handwork would always continue hand in hand with machine work, and they would have always to maintain and train the skilled hand."

GENERAL NEWS

Professional Announcements.

Mr. T. Lawrence Dale, F.R.I.B.A., has changed his London address to 20, Sackville-street, Piccadilly, W.1.

Mr. Martin S. Briggs, H.M.I., F.R.I.B.A., has removed to The Orchard, High-street, Mill Hill, N.W.7.

Mr. William T. Davenport, chartered surveyor, has removed to 13, South-square, Grays Inn, W.C.1.

A Surveyor's Estate.

Mr. John Campbell Barrett, of 194, Eccles Old-road, Pendleton, Lancs, estate agent and building surveyor, left £14,480.

Royal Sanitary Institute: 1928 Congress.

The thirty-ninth Congress and Health Exhibition of the Royal Sanitary Institute will be held at Plymouth from July 16 to 21, 1928, under the presidency of Viscount Astor.

R.I.B.A. New Session.

The inaugural meeting, which will be opened by the President's Address, will be held at 9, Conduit-street, W.1, at 8.30 p.m. on Monday, November 7. The Medal for the year 1926, which was awarded to Mr. Hubert Lidbetter, A.R.I.B.A., for Friends' House, Euston-road, will be presented to Mr. Lidbetter.

Roman Discoveries at Lancaster.

A silver coin, with a laureated head of Nero, inscribed "Nero, Cæsar," pieces of pottery, and traces of a camp fire, have been found by Professor Newstead, the Chester archæologist, during excavations with Professor Brood, of Liverpool University near the grounds of Lancaster Vicarage.

Incorporated Association of Architects and Surveyors

This association's new headquarters at 1, Wilbraham-place, Belgravia, S.W.1, will be opened at 11 a.m. on Saturday, October 22. We have received a copy of a souvenir giving a brief history of the Association since its inception, together with illustrations of its new home.

Mr. Robert Busby's Estate.

Mr. Robert Alfred Busby, of Knott End, Court Hey, Broad Green, Liverpool, architect, left estate of the gross value of £17,195

Norwich War Memorial.

The unveiling of a memorial to men who fell in the war took place at Norwich on Sunday. The memorial, designed by Sir Edwin Lutyens, is situated in the market-place, just in front of the 15th-century Guildhall.

Haywood and Tunstall War Memorial Hospital.

The foundation-stone of the new Haywood and Tunstall War Memorial Hospital, Stanfields, Burslem, was laid on October 1 by H.R.H. Prince Henry, K.G. The estimated cost of the buildings is £35,000. Messrs. Ford & Slater, F.R.I.B.A., Burslem, and Messrs Wood & Goldstraw, A.R.I.B.A., Tunstall, are the joint architects.

Ancient Monuments in Wales.

The work of restoration which has for some time been carried out by the Office of Works on three of the ancient monuments of North Wales—Ewloe Castle, Flint Castle, and Basingwerk Abbey—has now been completed, and the buildings will be formally opened to the public on October 20. Lord Peel, the First Commissioner of Works, will be present at the opening ceremonies, as well as the Archbishop of Wales and the Lord Lieutenant of Flintshire. Addresses will be given on the origin and history of the castles and the abbey by Mr. C. R. Peers, Chief Inspector of Ancient Monuments for the Office of Works, and the Inspector for Wales.

Contractor's Estate.

Mr. James Byrom, of Heaton-grove, Manchester-road, Bury, builder and contractor, Mayor of the town in 1899-1900, has left £126,951, net personalty £100,095.

Coventry War Memorial.

Lord Haig on Saturday unveiled the war memorial erected in the Memorial Park, which belongs to the City of Coventry. The monument consists of a tower of Portland stone, 100 ft. high, and has perpendicular features suggestive of rising clusters of broken columns. At the top is an electric lamp, and the base contains a Chamber of Silence, which is to be the keeping-place of the roll of honour, bearing the names of the 2,587 men of Coventry who fell in the Great War. The memorial was designed by the late Mr. T. F. Tickner, a Coventry architect, and has been erected under the supervision of his successors, Messrs. T. R. J. Meakin and Son.

Roman Pavement Found at Dorchester.

A Roman tesselated pavement has been found at Dorchester during excavations at the Dorchester Foundry. The men engaged in the work had excavated to a depth of nearly 6 ft., when a small portion of the pavement was brought to light. The work was then proceeded with carefully until several feet of the pavement was exposed, and it was seen to be a very fine mosaic of ornate pattern. There are six different colours in the pavement, including yellow, which is rarely found in such pavements. The pavement is apparently the forecourt or floor of a Roman villa.

Leplay House Christmas Tour.

The Committee of the Leplay House Educational Tours Association announce that during the coming Christmas vacation there will be a visit to Sicily to study the history of the island, mainly through its architecture, under the leadership of Mr. Stanley Ramsey, F.R.I.B.A.; also, a Regional Survey Meeting will be held at the College des Ecossais, Montpellier, by invitation of Professor P. Geddes. The studies are under the direction of Mr. George Morris, B.Sc. Full particulars may be obtained on application to Miss Margaret Tatton, F.R.G.S., Leplay House, 65, Belgrave-road, Westminster, S.W.1.

COMPETITION NEWS

University of Western Australia, Perth.

We gave in our last issue a brief announcement of the result of this competition. We have since received a copy of the assessors' report, together with the full awards, which are as follows :—

First Premium : Rodney H. Alsop and Conrad H. Sayce, Henty House, Little Collins-street, Melbourne, Victoria.

Second Premium : Donald H. McMorran, 34, Butler-avenue, Harrow-on-the-Hill, England.

Third Premium: Gummer & Ford, Auckland, New Zealand.

Placed Fourth : E. Summerhayes & Son, Colonial Mutual Chambers, Perth, W.A.

Placed Fifth : Hugh A. McQueen, Westminster House, 122, Longmarket-street, Cape Town, South Africa.

Placed Sixth : S. Woods Hill, 45, East 55 Street, New York City, U.S.A.; S. G. Garrett, 258, Swanson-street, Melbourne, Victoria; J. Gould King, 139, Wellington-street, Kew, Victoria.

Commended (in numerical order) :—

R. Keith Harris, 17, Bligh-street, Sydney, N.S.W.; B. J. Waterhouse, c/o Waterhouse & Lake, 17, Bligh-street, Sydney, N.S.W.; Leonard F. Herbert, 8a, Castlereagh-street, Sydney, N.S.W.; S. James Hurd, Sydney, N.S.W.: E. D. Wilson, Sydney, N.S.W.: C. L. Cummings and P. A. Jenkin, Royal Automobile Club Building, 94, Queen-street, Melbourne, Victoria; K. Anselm Odlin "Coo-in-noo," Kissing Pt.-road, Turramurra Sydney, N.S.W.; W. G. Bennett and W. Leighton, c/o Eales & Cohen, Prince's Chambers, 23, William-street,, Perth, W.A.; Jo Crust, "Sledmere," Silex-road, Mosma Sydney, N.S.W.. Oran A. Jenkins, 68, Po street, San Francisco, California, U.S.A and W. Hughston Craig, 56, Main-street, B Hill, Melbourne, Victoria.

Fifty-two designs were submitted. T assessors (Messrs. Athel J. H. Saw, Les Wilkinson, and A. R. L. Wright) in the report commend particularly the winne "ideas as to the general lay-out, the tow the loggia, the great hall, the empnasis the senate chamber above the great gate, t admirable adaptation to site conditions, a the general atmosphere he proposes to create

The Salterio International Competition at Como.

The Salterio Competition, which ha already been mentioned in our columns, wa judged recently, and the premiums ar medals were given out by the Crown Prin of Italy, who was at Como for the celebr tions. Although confined to designs for t (*cravatte*) the competition was a very i portant one, bringing large premiums money and four gold medals, and was sponded to throughout the world. The ju when they assembled at Como under t presidency of Senator Corrado Ricci, la Director of Fine Arts for Italy, with t Hon. Guido Marangoni, Director of the E hibition of Decorative Arts at Monza, Don Margherita Sarfatti, and several of the gre leaders in the silk industry at Como, such Salterio, Ravasi, and Tondani, with Profess Durieux, Director of the "Ecole des Bea Arts" of Lyons, to represent France, Gerevich of the Hungarian Academy Hungary, Professor Hoffman for Austr and V. Selwyn Brinton, F.R.S.A., for Gre Britain and the Dominions, found 7,000 signs waiting their decision. In these t Italians, of course, claimed the largest plac but France was very fully represented in signs from the Lyons "atelier." Aust came next with Hungary, and England wi the Dominions had a not large but go group of designs. The first premium 20,000 lire went to the Italian desig Gualdo Porro, and was unquestionably t best, but the second (10,000 lire), gained the Lyons School, came close behind it, wh the third, a beautiful design based on r butterflies, was perhaps more suitable for larger fabric, such as shawls, and the fou went to Frau Trussa, of Austria.

England gained two prizes of 1,000 l each, one going to Miss Edith Ashby, of t Fulham Art School, S.W., and the other Charles Humphry; but it may be mention here that at least two prizes were lost to Dominions—that from Canada being especia admired by the jury—because the design had overlooked the regulation, clearly sta in the rules, that each series must consist six different designs, and instead had peated one design, varying the colours.

Strode Park Estate.

The winner of the three prize building s in this competition is Mr. C. K. Shephe King's Court, 115, Colmore-row, Birmingha

Town Hall Extensions, Accrington.

The R.I.B.A. have nominated Mr. Herl J. Rowse, A.R.I.B.A., of Liverpool, assessor in a competition for proposed ext sions to Accrington Town Hall.

Manchester Town Hall Extension.

Manchester City Council, according to *Daily Telegraph*, has decided to postpone consideration of the million-pound town extension scheme, for which plans by Mr Vincent Harris, F.R.I.B.A., have been cepted. This decision will probably lea several years' delay in starting the work.

HE REGIONAL PLANNING OF WEST KENT*

VE have already had the opportunity of lying, under the guidance of Professor ercrombie, the problems of East Kent, and comes the regional report on the West t area from the experienced hand of W. R. Davidge. If it might have been gined possible to make comparisons be- en the two, a perusal of this later report clusively indicates that such a course is of the question. The two areas, separated a belt which, we presume, may be re- ded as "Central Kent," present few nts of similarity. The problem in East t largely turned on the conflicting claims he seaside resorts and the impending in- trial development. In West Kent the peting elements, if they may be so termed, the suburban development of London with complementary requirements and the de- nds of this productive agricultural area. s true that towards the north several im- tant industries are established, but these affect a relatively small portion of the ion dealt with.

n view of the evidence that Kent is the liest settled portion of England, and that proximity to the Continent has always de it the starting-point for each new phase English history, Mr. Davidge naturally ns the subject with an historical review ching on the evidences of occupation by leolithic and Neolithic man continuing on ough the ages of bronze and iron to Roman es, following on with notes on the Saxon, rman, mediæval and later activities. These es are accompanied by an interesting map wing the more important sites and build- s from the historic standpoint, together h a few views of representative buildings. e story of the old roadways finds a place this section.

The geological formation of the region, h its strongly defined features, is hardly interesting. Right across east and west runs the chalk escarpment of the north downs with the range of greens and hills to the south of it. Northward the chalk slopes gradually down to the Thames valley largely overlaid by tertiary beds. Southward the weald clays rise gradually to the broad sandstone ridge which forms the watershed between Kent and Sussex. It is worth noting that though the Romans carried their roads across the weald, subsequently much of this clay land became impassable and neglected, as witness the paucity of mediæval villages located there.

We may not linger over these preliminary studies, but must follow the author into those having a more direct interest for the regional and town-planner. After a review of the agricultural and industrial activities the report takes up the question of residential development. In the north-west this, where contiguous to the county of London, is suburban in character, and as the recent electrification of the railways is encouraging the extension of London in this area, it is here the need for detailed town-planning will be most urgently felt. Farther out the influence of London is still apparent in the growth of towns and villages possessing a good railway service. Housing schemes have been energetically promoted, and all the houses have been occupied without appreciably reducing the ratio of overcrowded dwellings, so that it is clear that further housing will be needed, and the author takes the opportunity of this need to point out the objectionable characteristics of "ribbon development" as compared with "group development." The first is destructive of the amenities of the main roads; it is uneconomic in services and in the long run an inconvenient mode of planning. The only reason for its adoption is that it utilises an existing road and thus evades saddling the cost of road-making on the property. It is pointed out that concessions have been made minimising this cost, but it is an open question as to whether something further ought not to be done to discourage building along main roads in the manner that is so generally reprobated.

For an area so largely rural, West Kent is unusually well provided with public services; large districts are sewered. The statutory areas of the public water undertakings cover the whole district—electricity more than two-thirds and gas almost the whole. Of course, it is not to be inferred that it has been practicable to carry supplies to the more thinly populated parts.

As might be expected at the present time, the question of traffic and roads takes an important place in the report. The main volume of traffic is to and from London, but there is also an important route running from Maidstone to Redhill. The proposals in this report include a new road for this traffic and another east and west route linking up Redhill with Tonbridge and Ashford. The radials from London are already receiving attention, and the more important suggestions for these take the form of by-passes at Godstone, Bromley, Sevenoaks, Tonbridge, and Maidstone. New roads from Erith to Greenhithe and from Wrotham to Lamberhurst are among those indicated.

Space will not permit us to do more than refer to the proposals for preserving and extending such amenities as the commons and playgrounds, woodlands and viewpoints, together with the maintenance of the interesting characteristics of the numerous old villages, and in this connection the opinion of the author on the control over the design for new buildings deserves the attention of all who have at heart the future of the rural character of our countryside.

New Railway Station, Johannesburg.

Plans have been prepared for the construction of a new central railway station in Johannesburg. The structure, which is to cost £350,000, will consist of a large central hall built in concrete after the Roman style, 200 ft. by 100 ft., with a dome-shaped waiting-room on the lower floor level. There will be space for parking motor vehicles.-

permission of Messrs. B. T. Batsford.

At Tonbridge. **At Penshurst.**

From the West Kent Joint Regional Planning Report, 1927.

WATTS'S "LAW GIVERS"

By THOMAS WILSON, Deputy Keeper of Westminster Hall.

The Honourable Society of Lincoln's Inn possess a range of buildings which in richness and variety of their architectural styles cover a period of over three and a half centuries. The Old Hall dates from 1489; the Gate House leading into Chancery-lane was finished thirty years later, and was built by one of the fellows of the Society who, besides being a great builder, seems to have been a versatile and remarkable man, since he fought for Henry VII. at Bosworth, was made Chancellor of the Exchequer for life, then became a Member of the House of Commons and was elected to the Speakership in 1485.

The New Hall, more directly our present concern, is a 19th century block of buildings which has importance as an example of the Gothic Revival. Designed by Philip Hardwick in 1843, it comprises the Hall, Benchers' Rooms and Library—the Hall being 120 ft. long by 45 ft. wide, and its architectural importance is further enhanced by the great fresco which G. F. Watts painted on the north wall and presented to the Benchers in 1859. The painting is signed and is a work of important historical significance in the tragic chapter of modern wall decoration. Since it must be easily the largest panel in England done in true fresco, the question of its condition and permanence must be a point of great interest both to painters and architects.

The years immediately following the Napoleonic wars were, as regards both architecture and painting, a period of mediocre production. Constable had prophesied in 1830 that English art would be dead in twenty years, and Dyce asserted in 1840 "that we have only artists of the highest sort, painters of pictures, and the lowest, those who make patterns," and the patterns, on all hands, were voted indescribably bad.

Mural painting shared in this common declension and debasement. There were, of course, the wall painters in oil, James Barry, Hilton and Haydn, but for their output there was little or no demand, and Hilton, perhaps the best of them, in the last years of his life had to confess that he had not had a single commission. But even this period had its signs of promise. Revival was in the air, both in painting and architecture, and if many more hopes and aspirations were born than achievements registered, still, seeds for future growth were sown.

The desire for a renaissance of wall painting in fresco persisted, and in 1840 there came an opportunity for a revival of the art on a grand scale in connection with the decoration of the new Houses of Parliament which had just started building. The twenty years which followed, 1840-1860, were years of feverish activity compared with the apathy of the past. One of the most successful pioneers of the revival, which was the direct outcome of the Fine Art Commission of 1840, was G. F. Watts, then a young artist in his early twenties. In public and open competitions two prizes had fallen to his brush, and though he was never selected for any considerable portion of the decorations ultimately carried out, he had established himself as a painter possessing the vision necessary for large wall spaces. His cartoon "Caractacus led in triumph through the streets of Rome," was awarded £100, and his second attempt, "Alfred the Great resisting the landing of the Danes," gained a premium, and still hangs in the large Committee Room in the House of Commons.

Such successes standing to the credit of a young painter of thirty was no mean achievement, but his initial attempt on a great wall space was yet to come, and it came ten years later at Lincoln's Inn. He seems to have never relinquished his early passion for large spaces, and one of the dreams throughout his whole artistic life was to be given the chance to work on the scale of the great masters of Italian fresco. He dreamed of a great Temple or House of Life, with stately walls on which to paint a series of decorations illustrating the mysteries of Life and Death. The opportunity never came and the dream faded, but midway he seized at least this one chance and offered the Benchers of Lincoln's Inn to paint in their New Hall a great fresco, 45 ft. high and 40 ft. wide. Watts's selection of true fresco for his colossal work, a method in which the colour is applied, section by section, during each day's work to the newly laid plaster ground, shows that he was one of the first of the modern painters to practise and attempt a revival of this ancient technique. Dyce also in his panels in the Queen's Robing Rooms at Westminster was at this time struggling with the many difficulties inherent in true fresco, and during the seven years while both Watts and Dyce worked on their respective panels, they had to meet and succeeded in partly conquering the difficult problems of what was to them a new technique in painting, and a process amounting to a rediscovery of a forgotten and long neglected art. If it is asked, why select a process which in its nature has so many inherent difficulties and one so subject to risks from atmospheric deterioration and decay, the reply is that any artist conversant with the great achievements of the fresco painters of the past, either in the primitive period or the later works of the masters of the Italian renaissance, could have no hesitation in selecting fresco as against oil on canvas. The permanent liquidity of colour and the exquisite "airy lightness and brightness" which ancient fresco painters achieved has been the envy and despair of all modern painters. To rediscover the "lost" secrets of their process has been the aim of European artists for the last sixty years to the present hour.

It was undoubtedly for this reason that Watts decided to paint the Lincoln's Inn panel in buon-fresco. Oil, it is true, is the most convenient medium so far placed at the disposal of the artist, but its history goes back no more than some 500 years, whereas some of the loveliest works, both of the east and the west, are far older, and their freshness and brilliance seem undiminished to-day. If we consider scale of colours this is greater in fresco. The darks and shadows of oil are certainly richer, but for brightness and luminosity fresco far surpasses it, and some will think, this more than compensates. As Dyce said, "in fresco if an artist is tolerably good colourist the air comes itself by the drying of the colours." In oi the pigment fades, the oil darkens.

Both Watts and Dyce knew the gre Italian schools of fresco, and Watts co menced his work in a spirit of noble emul tion of the great fresco-masters of the pas Both painters had to begin with the alphab of a new method and learn a difficult a trying technique, in the mastery of whi they of course made many mistakes. The work remains, however, as a splendid mon ment of an initial effort to rediscover a lo art.

Other painters, like Cope, Ward, Herbe and Maclise, who started on the same pat were almost driven to despair, and soug refuge in the "water glass" medium, which most of their final works were com pleted. Watts and Dyce held on to tru fresco and Watts's Lincoln's Inn "La Givers," after all the vicissitudes of th numerous attempts at its preservation an restoration, remains a master work of th revival, and one which the painter held be one of his very best efforts. To the en of his life he believed in fresco as a mea of raising English art to monument grandeur. He spent a great deal of time his early frescoes, and the medium infl enced his painting throughout his life; t large manner—a distinctive architectur quality and a structural conception of form are all due to his early concern with t wall, as are, perhaps, some faults in h later works.

Before passing to a consideration of condition prior to the present attempt at preservation, some remarks may be made "The Law Givers" as a work of art. So critics have asserted Watts's independence the schools as shown in this work, and a in his youthful and vigorous mural pa which is in oil and now hangs in the Pala of Westminster. On the contrary, it is on necessary to give the most casual conside tion to the matter to see that in both wor he was directly under the dominion of t great masters of the Italian Renaissan especially Michael Angelo and Raphael. "The Law Givers" does not directly ch lenge comparison with Raphael's "Sch

By G. F. Watts.

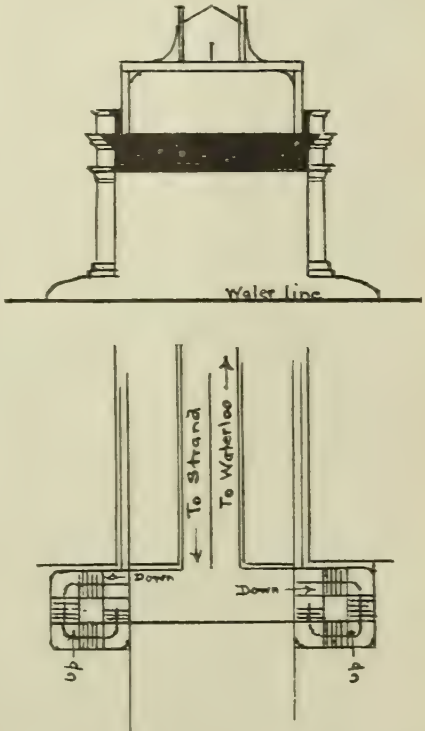
Athens," at any rate it is impossible to vent Raphael's panel immediately leap- into view when we see for the first time Lincoln's Inn panel, and the West- ster canvas is full of the gaiety of ur of the Venetian school, in fact, it was ally painted in Italy, and bears all the es of its origin. There is little intrusion he panel at Lincoln's Inn of Watts's later e when he became the "great cosmic t," when design and destiny too often ed to struggle for supremacy, destiny infrequently smothering design. Where work fails, perhaps, is in the power of n, but it has, as a compensation, an idual magnificence in the draughtsman- and drawing of the figures of the ous "Law Givers" when these are ed as detached units, and the work con- a series of admirable contemporary raits which have been neglected by ex- ors and critics of Watts's work.

e seventy years which have elapsed Watts completed "The Law Givers" period sufficient to allow of reasonable ctions being made as regards the anence of true fresco as Watts used the ss. Permanence has rightly been ed for the method. Experience, how- has shown that it has dangers of its Unequal durability of specific colours es simplification upon the palette; the ion and preparation of the lime need are that experience alone can give, and n more important than the pigments The process has, indeed, rarely been in its purity. Secco over-painting and ing up have, to a greater or less extent, the rule. There are two main objec- to the process, as hitherto practised, repel modern painters; the difficulty king alterations, and the time-limit which the work can be safely ed. Corrections and alterations involve tting out and destruction of previous which is itself no light objection. ver, in the English climate, there are al limits—from May to August—for orking in buon-fresco.

s hardly too much to say the steady oration of the panel shows that every one of the dangers mentioned has been actively in operation since Watts himself repaired the painting eleven years after he had finished it. The work began to show signs of decay at such an early a period and so badly as to induce the painter to write despairingly in the first decade of its history: "I hear it is beginning to decay, and I suppose it will go the way of all frescoes in England and speedily crumble away," and from this it is clear that there was something radically and fundamentally unsound, not in the process, but in the details of its practice, largely due, perhaps, to inexperience, and in some smaller degree to the temperament of the painter. In fresco the cartoon has to play an important function, both in the design and the actual painting. Here there was no cartoon, and the work suffered accordingly. The very defects of certain gifts and qualities which Watts possessed as a wall painter, his capacity for improvisation and a touch of individual magnificence in his draughtsmanship, all these were a temptation and a danger when exercised on so large a painting in true fresco. I can only repeat what I have written elsewhere when treating with this subject, that certain portions of the fresco have remained quite sound to this day, where, as all fresco should, the painting was done in a direct and rapid method and left, but where a secco has been resorted to, the colour has crumbled to powder, and great portions of the work could easily be blown off, rendering cleaning by either wet or dry processes impossible. The work was not painted rapidly and continuously, but at periods spread over a number of years from 1852 to 1859. This may account for the variation in texture of the plaster ground, which in some parts is dense and unabsorbent, and in others rough and open and therefore particularly liable to catch both dirt and acid impurities. Every further experience in dealing with pure fresco seems to indicate that painters using this medium need to be even more particular with the quality of their plaster than of the pigments they use. Here, though Watts was perhaps more familiar with the true methods of fresco than any of his contemporaries, it is evident experience was lacking in the prime importance attaching to the plaster, and he did not realise the absolute necessity that each component part of the painting must be of equal value as regards the ingredients used, and, that to paint over partially exhausted plaster is to court disaster. The poor adhesion of great masses of the colour was due to this cause—deficiency of the setting power of the lime—a defect which in the course of time the impurities of the atmosphere slowly reveals, rendering the colour friable and pulverulent and reducing it in many cases to a fine powder.

This was further accentuated by the fact that the painting was done with a freedom unusual in a work of such a size. Both in oils and fresco, Watts's practice was to work directly, and he seldom worked out his design from full-sized cartoons and usually used numbers of separate small studios, and in this case he appears to have drawn with great freedom and verve directly on to the plaster. The surface, therefore, necessarily shows many alterations, some cut out, others overpainted in strong secco, all of which tended to weaken the binding qualities of the plaster and the permanence of the paint when attacked by the impurities of the atmosphere. It is still true, as Professor Church wrote in 1891, that nearly all the figures and draperies which were painted in the simple, direct, rapid and straightforward manner, which the method of true fresco demands, are quite sound.

The condition of the fresco when it passed into my hands two months ago, showed the panel to be in a deplorable state, and it was evident that if something was not done its final and rapid dissolution could only be a matter of a few years. Drastic measures were therefore justifiable if it were to be saved. In selecting wax as the preservative, it was felt that if the choice lay between the preservation of the painting as an encaustic, and its steady and total destruction as a pure fresco, there could be no hesitation. By the application of mechanical means it has been possible to treat in one operation the whole surface, and so save all the friable and pulverulent colour by ingathering it into wax as a fixative. The surface is now so hard that it is possible to scrub it with the hardest hog-bristle brush and do no damage, and if the key of colour has been reduced it has been at least consistently lowered throughout, and the work has possibly gained a certain richness and volume in the process. At any rate, it has been saved, and with proper attention in the future, Watts's despairing cry that "it will speedily crumble away" may be frustrated and the panel saved for posterity for an indefinite period.



Mr. Harold Speed has watched the work of preservation from the painter's technical point of view as an enthusiastic lover of Watts's work, and has done the necessary repairs; and I have had invaluable help from the patient work of my assistants, Messrs. McLeod, Hampton, and Hardiman.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Waterloo Bridge.

Sir,—I enclose a rough sketch suggesting a way of treating Waterloo Bridge which would obviate the necessity of any alteration to the main structure. The idea is to carry a roadway for foot passengers above the bridge, with stairways, and possibly lifts on either side at each end, leaving the whole of the bridge for vehicular traffic. This would give a roadway of more than 40 feet and

should be sufficient for the amount of traffic to be dealt with.

The steel structure would be as light in construction as is compatible with the strength required, and if painted in varied colours—"camouflaged," in fact—would not be very noticeable against the solid stonework below. I give the idea for what it is worth; it may suggest a better alternative to some of your readers.

R. W. Knightley Goddard.

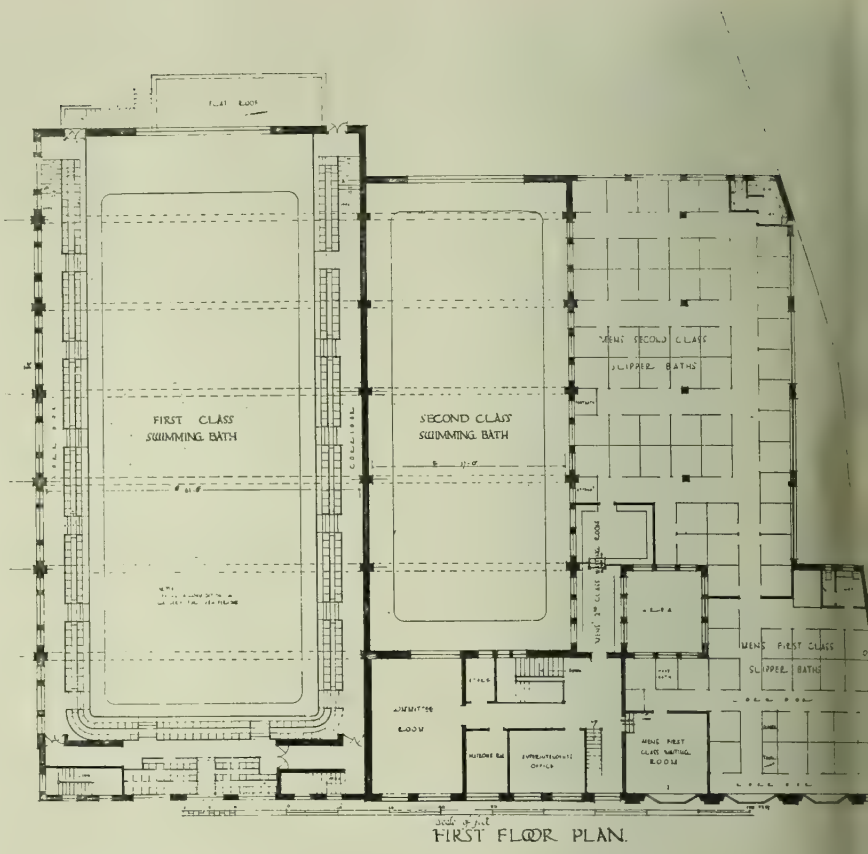
Watts's "Law Givers."

We illustrate, by means of a double-page inset and other photographs, the large fresco on the north wall of the Great Hall, Lincoln's Inn, W.C., painted by G. F. Watts. The fresco, having lately fallen into decay, has been restored by Mr. Thomas Wilson, Deputy Keeper of Westminster Hall and Clerk of Works to the House of Commons, from whose pen an article appears on page 572.

N.P. Branch Bank, Leatherhead.

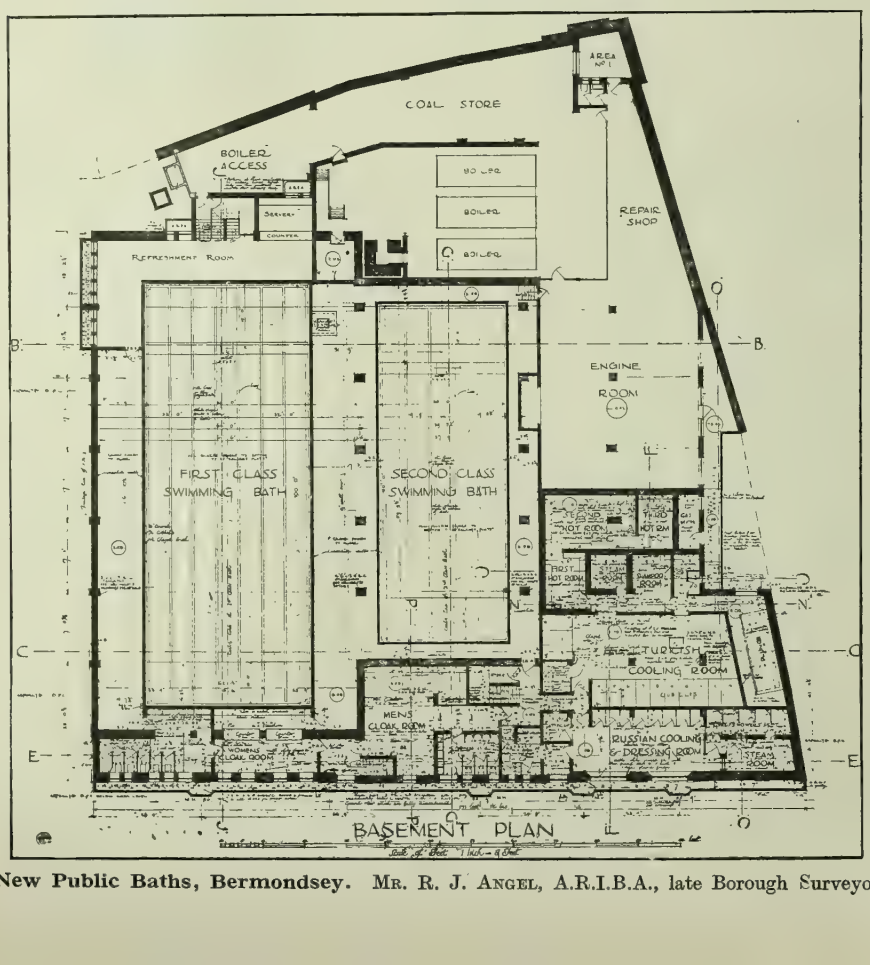
These premises are now in course of erection on an important site at Leatherhead The building is a half-timbered structure, with concrete floors. The interiors of the principal rooms are panelled. The builders are the Ringmer Building Co., and the architects Messrs. F. C. R. Palmer and W. F. C. Holden, FF.R.I.B.A., Surveyor and Assistant Surveyor respectively to the Bank.

New Baths at Bermondsey.



The plans of the new public baths for the Bermondsey Borough Council were prepared by Mr. R. J. Angel, A.R.I.B.A., M.Inst.C.E., when he was Borough Surveyor of Bermondsey. The accommodation provides for a first-class and second-class swimming bath, slipper baths for men and women, a Turkish and Russian bath, a public laundry, a laundry for establishment purposes, and residences for the Superintendent and Chief Engineer. T first-class swimming bath is 100 ft. long 39 ft. wide. The depth of the water is 8 at a distance of 15 ft. from the deep end, 3 ft. 6 in. for a continuous length of 10 ft the shallow end, with a uniform slope to deepest point. The water is 9 in. below floor level. The bath is of reinforced c crete, lined with asphalt and faced w glazed bricks. The shallow depth is at entrance end of the bath. A storage tank constructed under the first-class swimm bath in reinforced concrete, and the wate raised to the bath by a centrifugal pu The dressing-boxes are arranged along b sides, and made collapsible for adding sp for galas and public meetings. There i gallery on three sides, and lavatory accomm dation for both sexes, and a foot and sho bath near the entrance.

To enable the officials readily to pass fr one end of the bath to the other during sw ming contests a passage has been arranged the side behind the boxes. A club-room arranged off the bath-hall. On the grou floor there is a wide entrance doorway, r the pay-box; also one direct from the st for use during public meetings. A refre ment room is provided in the basement.



The roof is of reinforced concrete, 62 span and 43 ft. high above the footw around the bath, supported on main reinfor ribs. There are no ties or ironwork in swimming hall. It is believed that for c bined height and span this is the lar concrete span yet erected, the stresses which were calculated by Mr. B. L. Hu M.Inst.C.E., M.I.Mech.E. The ventilatio by roof ventilators, assisted by electric f and the hall heated by pipes and radiat As the hall will be used in the winter public meetings, there is a cinematogr operator's room, and a movable floor cover the bath.

The second-class swimming bath will 80 ft. long by 30 ft. wide. The depth of water is 6 ft. at a distance of 15 ft. from deep end and 3 ft. for a continuous lengt 10 ft. at the shallow end, with a unif slope to the deepest point. The dress boxes are fixed, and arranged along sides. The roof is similar to the first-c but 39 ft. span, and 31 ft. high.

The women's slipper baths are on

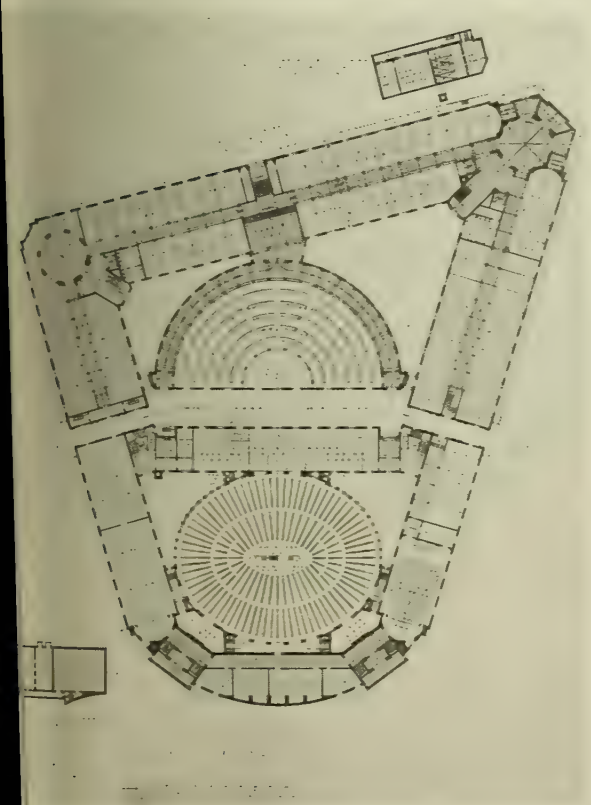
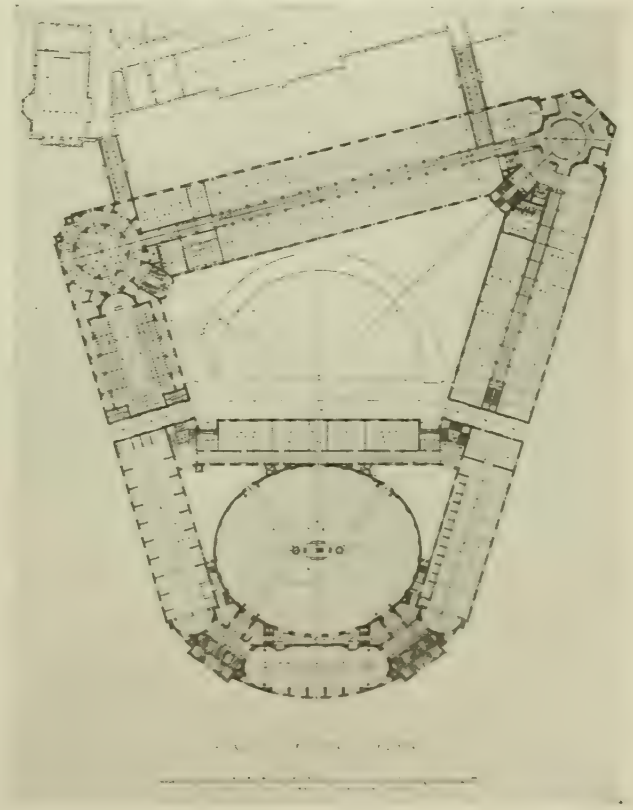
nd floor, with waiting-room accommoda-. The men's slipper baths are on the floor, also with ample waiting accom-iation. The whole establishment (with the eption of the laundry) will be worked from pay-box. On the first floor there will be mittee rooms and superintendent's office. he men's and women's cloakrooms for use ng public meetings are in the basement. he Turkish and Russian baths are in the ement, and consist of a large waiting-room, m rooms, shampoo room, with plunge and wer bath, dressing boxes, and a separate ng room with cubicles. The walls of the mming baths are lined throughout with u-marble. The public laundry is ap-ached from Woodlands-place, and has a et-office and waiting-room and lavatory mmodation. The laundry has the usual hing-troughs and drying-horses, together n mechanical washers and hydro-extractors. ironing-room adjoins the laundry. The blishment laundry is on the ground floor. basement contains accommodation for ers, plant, and coal-bunkers, also room for ing the temporary floor and chairs.

he consulting engineer for the reinforced crete was Mr. B. L. Hurst, M.Inst.C.E.; engineering equipment, Mr. W. M. Binny, I.I.C.E.; and for illumination, Mr. Leon ter. The quantity surveyors were Messrs. rge Corderoy & Co.



he contractors for the first section (public ndry) were Messrs. William Moss & Sons, d., the contract for the remainder, and major, portion of the work having been dertaken by the Borough Council, by irect labour," under the direction of Mr. E. Baker, the General Manager of Works. is included the swimming baths, slipper hs. Turkish baths, etc. The whole of the nforced concrete and steel bending was ne by this department.



Following is a list of the sub-contractors :—The Indented Bar and Concrete Engineer-Co., Ltd., reinforced concrete specialist igners; Shaws' Glazed Brick Co., Darwen, rmola glazed terra-cotta, to the front ele-ion, also glazed bricks; Ragusa Asphalte ving Co., Ltd., asphalt to roofs and damp-of courses; Marbello, Ltd., Marbello parti-tions to slipper baths, and Terrazzo floors; Manu-Marble Co., Manu-marble wall linings, and floor tiles; Paragon Glazing Co., and J. H. Walker, Ltd., West Bromwich, patent glazing and lantern lights; Carter & Co., porcelain baths, urinals, and lavatory fittings; United Strip and Bar Mills, Ltd., Sheffield,

Rhodes & Westlake, laundry equipment in the establishment laundry; Messrs. Pulsometer Engineering Co., circulating pumps and steam-operated pump to drainage system; Messrs. Sturtevant Engineering Co., Ltd., vacuum cleaning plant.

The contract for the electrical installation was undertaken by the Borough Council's Electrical Department, under the control of Mr. W. E. J. Heenan, M.I.E.E., Borough Electrical Engineer. The following firms supplied materials for the electrical equipment:—The St. Helens Cable Co. and Rubber Co., Ltd., Slough, cab tyre sheathed cables; The Wholesale Fittings Co., Ltd., Kartret Switchgear Co., Ltd., Sutton Surrey, General Electric Co., Ingram & Kemp, Birmingham, electricity cables, accessories, switches, etc.; The Silicate Paint Co., Charlton, paints.

Manchester Town Hall Extension Competition.

We illustrate this week the design submitted in this competition by Mr. E. Berry Webber, A.R.I.B.A. It is the result of an endeavour to plan the two main portions of the scheme as one harmonious whole, at the same time allowing the reference library to be distinctly cut off, and easy of erection by itself. The Town Hall extension is planned round a large courtyard which separates it from the library. In this courtyard is placed the Joint Accounts Department, designed as a one-story semi-circular building capable of being isolated as desired. An access road is shown dividing the main portion of the scheme, and tapping the service quarters. The new Council Chamber has been planned at the junction of Lloyd-street and Mount-street, directly connected to the State apartments in the old Town Hall by means of a bridge.

The central feature of the Reference Library is the large elliptical reading hall on the first floor, round which are grouped the lesser reading rooms, arranged so that they may be used independently. The staff enclosure has been so placed that it commands all the public entrances and exits to the whole suite of reading rooms, and is in direct communication, by stairs and lifts, with the main book-stack under.

Externally, an attempt has been made to echo the "scale" rather than the "style" of the existing Town Hall, by carrying through the main horizontal sub-divisions and roof line, of the Gothic façade, and a simple treatment in the Florentine manner has been adopted as being the least discordant. The street façades have been treated throughout their length and punctuated on the sides by the large entrances to the courtyard, separating the two main portions of the scheme. On the south front the design has been allowed to become somewhat more monumental, thus expressing the individuality of the library portion. The great elliptical reading room has been allowed to express itself externally, and the curve of the façade follows this, thus regulating the awkward angles and the conflicting lines of the site at this end.

Chingford Masonic Hall.

The plans for this building, prepared by Mr. Stanley R. Miller, A.R.I.B.A., have been approved by the Urban District Council, and are now before the Essex County Council for the purpose of obtaining a music, dancing, and stage-play licence, and have been accepted under the town-planning scheme. The proposal is for a building which, notwithstanding a Masonic appearance, shall, with the exception of the Temple, be equally suitable for non-Masonic purposes, and while not involving the expenditure of more than £9,000 (excluding purchase of land and furnishing) at present, will be capable of extension as time or circumstances may require.

The Temple is 40 ft. by 30 ft., and is designed solely for Masonic purposes for which it will be consecrated. It will accommodate 170 Brethren. The Masonic east end is raised three steps, of which fact advantage is taken to give additional height to the kitchen below. Communicating with the ante-rooms and served by both the public and Masonic staircase is the Banquet Room, 44 ft. by 26 ft., capable of seating 170 diners. The Assembly Hall is 62 ft. by 42 ft. For banquets it will seat 250 diners, and for concerts and similar purposes, 450 persons

ARCHITECTURE OF ANCIENT GREECE AND ROME

"The influence of the past upon the present is part of the nature of things in which we live and move. . . . Progress in every department is attained only by making good use of the experience of the past." These words, from the early pages of the *Architecture of Ancient Greece*,* suggest the reason for the position held by so well-known a work as that by the late Messrs. Anderson and Spiers, quite apart from its eminent literary standing. The interaction between past and present operates in both directions. It is due to the effect of present-day research that so much of the past is now not merely an unseen influence, but something that can be critically examined. Its various manifestations may be handled, analysed and probed until the mind of to-day can reconstruct with marvellous accuracy even trivial details of thousands of years ago. However much modern art may desire to demonstrate its freedom and independence, it is as impossible for it to free itself completely from the past as it is for an oak to claim freedom from the parent tree from which the acorn fell. Reversions to particular phases of past architecture may occur, with the avowed intention of attempting thereby some measure of "originality"; or the tenacity with which "traditional" lines are followed in other cases may, according to the way in which they are used, either maintain a just balance, or act as a drag upon progress. "In what way to use tradition is the problem of modern architecture." In any case, acquaintance with the history of the building arts of the past, particularly of the two great world-moving nations of Greece and Rome, is as essential to-day as ever, for a right equipment for architectural practice and appreciation.

It is not, therefore, surprising that Messrs. Batsford have seen fit to reissue so important a work on ancient architecture. That the book now appears as two separate volumes is a natural consequence, firstly, of the increased matter and illustrations, and secondly because the task of revision has been undertaken by two scholars, specialists respectively in Greek and Roman archæology, attached, the one to the American Academy at Athens, the other to the British School at Rome. Each has brought to bear upon his allotted section his own first-hand knowledge as well as the illumination supplied by research in other directions. But care has been taken not to obtrude new personality into the volumes so definitely associated with the names of the original joint authors. The successful accomplishment of this difficult aspect of the undertaking is perhaps more evident in the volume on Greece, because Mr. Dinsmoor was in the position of having to re-write large parts of the book to bring it up to date, owing to excavations prosecuted since the work originally appeared. Particularly is this the case in regard to the early Cretan civilisations. The Roman volume shows, naturally, rather less entirely fresh matter. The point of view of the reviser, Dr. Ashby, is indicated in his preface, and it is less in respect of new facts than in respect of new approaches to facts that the new edition of this part is distinguished. Both occupy important places in the well-produced "Historical Architecture" series. The illustrations, from photographs, maps, plans, paintings and drawings, provide abundant means whereby the eye can assist the mind in acquiring such knowledge of the architectural past as may promote the progress, beauty and practical efficiency of the architectural present. Only by the acquisition of knowledge of all kinds can the student and practitioner to-day build rightly for the present and the future. "The architect's retrospect . . . ranges over the larger traditions of all architectural history, choosing the good and refusing the bad." It was the intention of those upon whom devolved the task of revision and enlargement, as well as of the original authors themselves, to help to contribute towards the materialisation of a visioned future when "out of this selective use will come, in the fullness of time, a living art as noble as Greek, more cosmopolitan than Roman, and perfectly characteristic of the age we live in."

E GREAT SCULPTURES AND EAST PEDIMENT

ntinued from last week's issue, page 548.)

n the extreme angles of the pediment re the rising sun and setting moon. These ups of Helios and Selene with their teams horses seem a little dry and empty in the oration. The vase paintings, however, w that the chariot-drivers would have d long rods or goads. On a vase in the seum, added in 1920, Helios leans for- d with arms outstretched, reins in one d, and a long driving rod in the other, this must represent very nearly what Parthenon sculpture was like. The reins not go directly to the hands of the er, but passed down to the collars of the ses. The horses were sharply checked, as wn by their jaws and creases where their ds join the necks. Helios, on the vase nting just mentioned, has a scarf or shawl his shoulders with free ends flying out ind: this suggests how the scarf of Selene t have been disposed (Fig. 5). Compare

Fig. 5 (restored).

the Krater E466 in the Museum and coins f yracuse.

Selene's horses were being turned outwards e angle of the pediment. Her arms were ded and thrown free of her sides, so must have been supported by the ends he scarf or mantle turned round them flying back on the wind (Fig. 5). At eMuseum the figure of Selene is placed close to the head of one of her horses, this is so also in the illustrated guide. nsiderable interval, however, is neces- if we are to imagine the existence of rs' bodies sunk in the sea. Such an eral is shown by Sauer in his survey of races on the cornice—it would have been ied by reins and a driving-rod. Along dge of the mane of the horse's head in Iuseum are several drilled holes; can have contained feathers similar to those are on the heads of the horses of un on the Blacas vase in the British m, or were there little gilt bronze balls shining like drops of water? This s head is set up in the Museum hardly parallel to the front as it must have been, gg by the cutting where the inclined e passed it.

heads only of the horses and the upper of the figures of the drivers are set on the plane of the cornice to represent rts rising from and setting into the . Such sections of figures were adapted the methods of painting. As used in medium, one example had been the of a saying — "more quickly [done] Butes," because Butes had been repre- only by his head.

now generally agreed that the reclin- d who faces Helios is Dionysos (Fig. 1). non says: "Dionysos without doubt"; r. Cook is of the same opinion. In *ures of the Parthenon* it is explained he name Theseus was given to this when the whole subject of the pedi- was thought not to represent the birth goddess—"though not happy it is probable that it will be permanently attached to the statue." Permanently is a long time! In the row of metopes beneath this pediment Dionysos occupied the second as here he has the second place; on the frieze also he was the second of the gods. A number of parallels in sculpture and painting exist which confirm the identification with Dionysos. A vase painting given in Miss Harrison's *Athens* (p. 261) looks as if it had been done with a memory of the sculpture. Here we have a similar youthful type, general attitude and position of arms, the rock and its covering, and even shoes on the feet. A drilled hole on the ankle shows that the statue had bronze shoes. The head of this figure is the only one which is still attached to a body. It is much weathered on the outside, but at the back the character of the original work may be inferred; the ear is there, and the hair was wrought into sharp little locks. Dr. Cook sets a bronze wreath on the head of this figure. There do not, however, seem to have been any rivet holes for fixing such an addition of metal to the head; if there were I should suggest that bronze curls might have been attached at the back.

The next pair of figures are of goddesses seated, one with her arm on the shoulder of the other (Fig. 6). The turn of their necks shows that they were conversing. It is agreed that these are Demeter and Persephone, and the restoration by Mr. Guy Dickens of a later but very similar group from Lycosura makes this quite certain. There is some question as to the order of the two; the place nearer the centre seems the natural one for the mother. The left arm of this figure was raised, and I suggest that the hand held a long torch for support. Among the fragments illustrated in *Sculptures of the Parthenon* is one of a female hand holding part of a round ribbed object which seems to resemble the torch represented on the E. frieze as carried by Demeter.

Next to these and nearer the centre is an erect female figure in the attitude of one startled (Fig. 3). In my former attempt to describe the E. pediment (1908), I made a restoration of this figure and suggested that she was Eilithyia, a discarded identification of the past. Dr. Cook agrees. The only alternative name possible would seem to be Hebe: all that we are told in the Museum *Guide*, 1925, is that "the graceful figure of a young woman has generally been called Iris: but the action is that of a person starting aside in alarm, so the name must be considered uncertain." In regard to the placing of this figure I would point out that a vertical plane surface at the back of the flying mantle must show where it came into contact with the face of the pediment. This plane is not parallel to the front of the pedestal as now set up, but at an angle of 20 to 30 degrees to it. The figure should be turned by so much towards the centre of the pediment. A sculpture of a startled woman at Ny Carlsberg seems to be much of a copy of this figure from the E. pediment. This figure grouped closely with Demeter and Persephone as is best shown in Pars' careful drawing of the E. pediment in the British Museum. Sauer leaves an interval which does not seem to agree with the indications on his own plan. We pass now to the other existing figures once on the right-hand side of this pediment.

In 1903 I made some suggestions for the restoration of the great triad of figures usually known as the Fates (Fig. 5). I pointed out the close resemblance of the second and third figures (Fig. 2) to those of Aphrodite and her companion on the eastern frieze, and concluded that "the frieze figures are adapted from the great statues." This resemblance is so marked that it amounts to a leading fact which must be taken into account in explaining the pair of figures both in the pediment and on the frieze. This point has already been partly discussed in the description of the frieze. Notice the crossed feet of the reclining figure in both cases; those of the great statue can be well seen from behind.

Another fact forgotten, if not new, is the observation that the reclining figure had a metal necklace, the holes for attaching which remain. This, with the bracelets which she also wore, the deeply girt zone which can hardly be other than the Cestus of Venus, and the luxurious, soft raiment which has slipped down from her shoulder, all show that she can be no other than Aphrodite, as some scholars long ago thought. Collignon (1912) identified this figure and her companion as Aphrodite and Dione "without doubt."

Lechat takes the identification with Dione and her daughter for granted, and says of the reclining figure: "This miracle of poise between carelessness and sovereign grandeur" can be no other than Aphrodite. Furtwängler allowed that it was Aphrodite, but argued that she appeared here as one of the Fates. Such a double meaning does not seem like the direct method of sculpture; and would it not be inappropriate to let even Aphrodite,

Fig. 6 (restored).

if figuring as one of the Fates, have so much jewellery?

In the Museum *Guide*, 1925, the identification with the Fates is still maintained, and an illustration is given in which "an attempt has been made to restore the reclining Fate with distaff and spindle."

This restoration was suggested by Furtwängler, who wrote: "The left hand of this figure was raised, and held loosely a bronze attribute in the form of a staff, as is shown by a hole in the drapery on the left hip. . . . The missing attribute was without doubt the distaff and her right hand drew the thread. They are the three *Moirae*, the daughters of Night. The Fates were always supposed to be present at a birth. The *Moirae* were not conceived as ugly; indeed in Athens Aphrodite was accounted the eldest; in poetry they are called the fair-armed daughters of the Night." This quotation is taken from the volume on sculpture written in association with Urlichs in 1898. In the later edition of 1911, revised after Furtwängler's death, Urlichs says: "The figure on the left has been separated from the others, and on the assumption that Olympian gods must all be present at the birth of Athena, preference has been given to the identification of the other two figures as Aphrodite resting on the lap of Peitho or of her mother Dione; the goddess of Persuasion [Peitho] was honoured with her in a common cult. . . . The third figure has been called Hestia."

My view was and is that the hand of the extended left arm of the reclining figure received support from the bunch of drapery on the thigh; the first figure of the west pediment had the arm supported in like manner. Compare a vase painting of Aphrodite

reclining and draped, Reinach 1, 405; and in the Salting collection at South Kensington a Tanagra terra-cotta of the goddess. I cannot believe in the distaff theory; for one reason of many the beautiful lady is represented as just awaking from sleep.

Dr. Cook accepts the identification with the three Fates, but he gives the distaff to the first one, not the third. In his restoration the arm of the reclining figure seems to be unsupported, and the head is not made to rest, as traces show that it actually did, on the shoulder of the middle figure. Professor Beazley, too, in the last word on Greek sculpture, 1927, speaks of the reclining figure as "the nightward Moira." On the other hand, Charles Picard, in the most recent French history of Greek sculpture, names the three figures Hestia, Dione, and Aphrodite.

The starting point of the theory that the three figures were the Fates was furnished by a late relief on a circular well-head which represents the birth of Athena, and probably imitates in some degree the central group of the Parthenon. The only figures of the relief besides Zeus, Athena, Nike, and Hephaistos, are the three Fates. Two of these, however, are standing, and they in no way resemble the sculptures of the Parthenon. As the relief is carved on a circular object, the group of the Fates is exactly opposite to the Birth of Athena, and cannot be seen with it. The prominence of the Fates on the puteal counterbalancing Athena's birth may be significant for the meaning of this work of the Roman age — something like the glory and decay of Athens might be intended. It seems to me most improbable that any suggestion that their great goddess was subject to the Fates would have been a chief element in the sculptures of the national temple erected in her honour as goddess of Victory. Nor can I think it probable that Aphrodite would have appeared, as Furtwängler claimed, as one of the Fates where she was wanted as a great goddess in her own right. Again, it would be impossible to defend — except by supposing poverty of invention—the fact that she and her close companion were imitated in the eastern frieze, where the figures certainly represented Aphrodite with another goddess and not two of the three Fates. The great group of three has also been called the three Graces, and this seems to me much more likely than the Fates: in that case the companion of Aphrodite on the frieze could be a Grace; Charis was represented by Pheidias on the base of the great Zeus at Olympia.

In considering the whole evidence regarding both the E. pediment and the E. frieze, I am drawn to the conclusion that Aphrodite and her mother Dione were the goddesses represented by the reclining figure and her companion. For the first figure of the great triad of goddesses in the pediment, the most general identification, other than a Fate, has been to name her Hestia, as was first done by Leake in 1821 (Fig. 5.) If we break away from the Fates this interpretation is the most probable. The noble figure is separate and leans away from the other two, although from the way in which the "plans" of the two figures conform to a similar curved line it is likely that they were very close together. By her right side, towards which the body leans, is a space which would take an altar or a hearth.

The middle figure of the triad, as I showed in 1908, and as had been noticed by Watkiss Lloyd, drew up her mantle to her shoulder with her right hand. A part of the back of this figure is roughly hacked away as if to give room for the left arm of the first figure (Hestia), which may have been turned upward with a raised hand.

Through all these tedious arguments recollect for simple final impression the enthroned Zeus, and in front of him a shining figure of Athena: these in the middle, while on either hand are spectator gods and then the chariots of the sun and moon in the angles. Imagine further the bronze accessories, the bright colour, the glitter, and the gold of it all.

SOCIETIES AND INSTITUTIONS

Institution of Civil Engineers.

The Council of the Institution of Civil Engineers have recently made the following awards:—

The Howard Quinquennial Prize to Professor W. E. Dalby, M.A., B.Sc., F.R.S., M.Inst.C.E., in recognition of his researches on the strength and structure of iron and steel.

The Indian Premium to Mr. A. W. Stonebridge, M.Inst.C.E.

For selected engineering Papers published during session 1926-27:—

A Telford Gold Medal to Sir E. Owen Williams, K.B.E., B.Sc., M.Inst.C.E. (London); Telford Premiums to Messrs. E. H. Salmon, D.Sc., M.Inst.C.E. (London); R. S. Cole, M.A., Assoc.M.Inst.C.E. (India); H. Mawson, D.Sc., Assoc.M.Inst.C.E. (Liverpool); and A. H. Douglas, M.C., B.A., B.A.I., Assoc.M.Inst.C.E. (London); and a Crampton Prize to Mr. D. McLellan, M.Inst.C.E. (Glasgow).

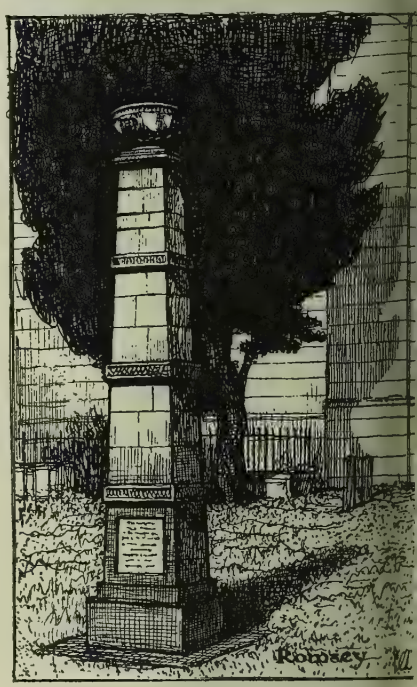
For papers read at students' meetings in London or by students before meetings of Local Associations during the same session:—

The James Forrest Medal, the James Prescott Joule Medal, and a Miller Prize to Mr. R. F. Legget, B.Eng., Stud.Inst.C.E. (Liverpool); and Miller Prizes to Messrs. A. H. D. Markwick, B.Sc., Stud.Inst.C.E. (Ferrybridge); F. C. Jordan, B.Sc., B.Sc.Tech., Stud.Inst.C.E. (London); L. G. B. Rock, Stud.Inst.C.E. (London); C. J. Chaplin, B.Sc., Stud.Inst.C.E. (Wakefield); and F. V. Cornish, B.Sc., Stud.Inst.C.E. (Tankerton).

Iron and Steel Institute.

The Council of the Iron and Steel Institute has recently awarded the Carnegie Gold Medal for the year 1925 to Mr. A. L. Curtis, Westmoor Laboratory, Chatteris, in recognition of his research work on steel moulding sand, etc.

Department of Architecture, Technical College, Cardiff.



A scholarship covering tuition fees and a maintenance grant of £40 per annum for three years at the Department of Architecture at the Technical College, Cardiff, has been awarded to Mr. W. J. Davies, of Nantymoel, Glamorgan. These scholarships, which are open to residents and non-residents of Cardiff, are awarded annually on the results of an examination of about the same standard as matriculation in the following subjects:—English, mathematics, a modern language, physics with mechanics or chemistry, higher mathematics and history or geography or elementary architectural drawing. Candidates must satisfy the Head of the Department of Architecture as to their ability in elementary drawing.

Further particulars concerning these scholarships will be supplied on application to Mr. W. S. Purchon, M.A., A.R.I.B.A. (Head of Department of Architecture), the Technical College, Cardiff.

The "Tricity" New Showrooms.

The new electrical showrooms at Wellington House, Strand, W.C., of the British Electrical Transformer Company were formally opened on Wednesday, October 5, by the chairman of the company (Mr. A. F. Berry). These showrooms are the work of Messrs. Imrie and Angell, F. and L.R.I.B.A., and have been designed for the purpose of displaying the "Tricity" Sunray radiators. The showrooms are entered through an oak-panelled corridor having a semi-circular gilded ceiling illuminated by concealed light from the top of the panelling. This corridor leads into a vestibule whose walls are divided into bays by brilliant blue-green pilasters, each bay being panelled, the walls and ceilings are a warm honey-yellow colour, the caps a bases of the pilasters and other ornam being treated in a low tone of gold on background of rich red. An arched openi (facing the entrance) hung with brillia orange curtains, leads into a large ro devoted to the display of "Tricity" cooke heavy restaurant apparatus, etc. On the l of the vestibule an opening leads to a ser of compartments designed to repres corners or portions of rooms, where are d played various designs of Sunray radiat and flame fires.

The first of these rooms is a dining-roo The walls are divided into panels with bla and gold mouldings, the panels bei papered with a red leather paper, occasion panels being filled in with applied deco tive flower pictures. The curtains are old gold satin, and the floor is covered wi a plain golden fawn pile carpet. The ro is furnished with antique mahogany furn ture. The adjoining compartment represe on one side a portion of a bedroom, and the other a bathroom. Next is corner of a drawing-room treated in a mo or less traditional Georgian manner wi large panels, a moulded wood cornice and open fireplace in the angle. The l room of the series is a sun parlour. He are shown the various forms of Sunr radiators made by the British Electric Tra former Co., emitting rays that both look a feel like natural sunlight at its best. A no feature of each room is an indicator, whic shows in pence per hour the cost of runnin the apparatus.

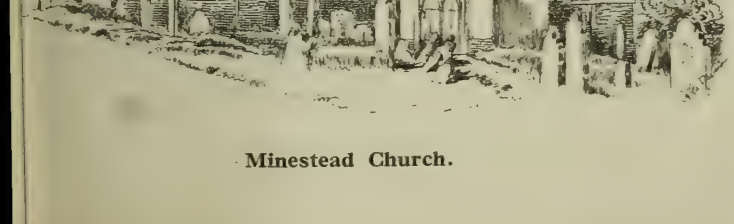
THE TOWN-PLANNING INSTITUTE

h Annual Country Meeting, Winchester.

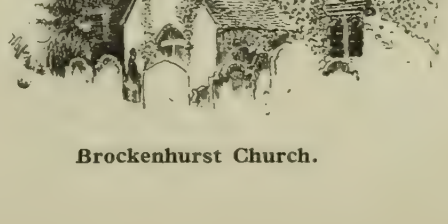
HE Ninth Annual Country Meeting of Town-Planning Institute was held from ber 6 to 9, at Winchester, under the idency of Mr. G. Montagu Harris, E. The Conference was a highly suc- ful and enjoyable one, due both to the weather and also to the excellent arrange- s made for the members' comfort and sure.

ie company assembled at Winchester on rsday evening, and on



Friday, October 7.

left by motor chars-a-banc on a visit to hampton. Arriving there, a most inter- g and instructive morning was spent ecting the various sections of the Ord- e Survey Department, where, by the ness of the Director-General, Lt.-Col. . C. Cooke, D.S.O., the whole process of ey map-making was explained. This was wed by a luncheon, held at the South- tern Hotel. The President occupied the r, and the guests included :—The Rt. . Lord Montagu of Beaulieu, K.C.I.E.; E. K. Perkins, M.P.; Principal Vickers; rman H. J. Blakeway; Alderman P. V. yer, Mayor of Southampton; Lt.-Col. S. C. Cooke, D.S.O.; Ronald Shepherd, ; G. L. Pepler, F.S.I.; Alderman J. S. ey; Edward Willis, M.Inst.C.E.; W. T. ne; Alderman Rhodes; F. L. Thompson, I.; A. H. Schofield; Dr. Raymond in, F.R.I.B.A.; Reginald Bruce, I.B.A.; T. Peirson Frank, M.Inst.C.E.; P. Cart de Lafontaine, A.R.I.B.A.; J. A. evear, P.A.S.I.; F. M. Elgood, O.B.E., I.B.A.; Barry Parker, F.R.I.B.A.; Her- Collins, A.R.I.B.A.; S. C. Foulkes, I.B.A.; B. F. Brueton, A.R.I.B.A.; Theodore Chambers, K.B.E.; H. S. er, A.R.I.B.A.; T. Alwyn Lloyd, I.B.A.; Bryant Hall, U.S.A.; W. R. dge, F.R.I.B.A.; Professor S. D. Ads- M.A.; R. F. Gutteridge; and A. R. r (Secretary).



e loyal toasts honoured, Mr. G. L. Pepler, ., in proposing the toast of "South- ton," said that the city's strategic situa- in respect to transport and its relative mity to London gave it every advantage field for industry, and it enjoyed a rich ge in its history, its parks, and in one e handsomest road approaches of any in England. These were some of the tages the city enjoyed. What was it to make of the opportunities afforded? ience clearly showed that things would rt themselves out aright if left to them- or to the mercy of varied and often ting interests. On the contrary, if un- inated and uncontrolled, they tended, ally to destroy more than they created. Happily, however, they needed no longer be so left, because Parliament had given local authorities the power and duty to direct development by means of town-planning schemes. It seemed, therefore, that if the city desired to preserve the good it held and to make full use of its advantages, the only possible course was first to survey the ground, take careful stock of what it possessed, of its possibilities, its present handicaps, of the needs of industry and of its people. Next, in consultation with its neighbours and the principal interests, such as those owning the docks and the railways, those supplying electric power, landowners, etc., there should be decided a policy of development for the city, and then a Town Plan laid down to guide development in such a way that that policy might gradually be realised. An additional stimulus, he remarked, to the making of surveys and plans was afforded by the fact that this was the home of the Ordnance Survey Department, which produced the finest maps in the world, which they had that day inspected with the greatest possible interest. Town Planning (which was essentially team work) had made great strides in this country, and there were now nearly 600 areas being planned by about 380 local authorities, the majority of whom did not come within the compulsory provisions of the Act. In addition, some 45 main Joint Town-Planning Committees had been established, covering about seven million acres of land. These Joint Committees, disregarding local boundaries, were dealing with social, geologic, economic, etc., facts, so that each part of each region might function to the best advantage, in the interests of the whole unit. As far as he knew, Southampton had not yet taken any part in all this activity, although not distant neighbours had done so, and the City, for which a scheme was required by 1929, had probably more to gain from town and regional planning than had almost any other place in the country.

The Mayor, replying, said the toast was one that was very dear to the heart not only of himself but of every colleague of his on the Borough Council. They were proud of their town, and loved it. As had been so rightly observed, they had the finest road approach to their town that could be found in any part of the British Empire, but little reference had been made to the approach by water, and he challenged the representative of any other town or city of the Empire to name a more magnificent scene than presented itself from the decks of any ship as it entered the Port in daylight. They were fortunately situated in Southampton, inasmuch as Nature had planned the directions in which their town could extend. They were limited by the water on the one side, and their town was simply extending up and up, and out and out, towards London, Portsmouth, and Bournemouth. They had a wonderful avenue and parks, and also a beautiful common, which was about 365 acres in extent. That, in itself, was a wonderful health valve for the town. There were one or two congested districts, where it was impossible to put any more parks, because commerce had stepped in and prevented it. He could assure them that his colleagues were not unaware of the possibilities of improving the town by fresh avenues, or roads, cut through from point to point. They had not yet adopted a town-planning scheme in the sense that Mr. Pepler had mentioned, but he knew that the matter was receiving consideration.

The only other toast, that of "Transport," was proposed, in the unavoidable absence of Lord Apsley, D.S.O., M.P., by Mr. Edward Willis, M.Inst.C.E. (senior vice-president). In connection with town planning, he said, transport was an essential factor, and it was the life-blood of any civilised community. If they looked back to the years 1914-18, there were many who said that transport eventually settled the war. He looked forward to the early introduction of a scheme wherein proper and efficient town planning and a co-ordination of transport would be placed before the townspeople of Southampton, and receive their unanimous approval. As the Mayor and Mr. Pepler had observed, the town of Southampton was especially fortunate in its two exits—its exit by sea, and its exit by road—and he could even remember that from the last time he visited the town, which was over 42 years ago. He did see, however, that there was really room for town planning in that town. He had known of cases where small areas of property had been acquired, and the amenities of the whole area had been ruined by factories. That was going on. It was only by town planning that there was any prospect of preventing that. Southampton was really a place where regional planning could be brought into operation, because transport from a centre, which should be a live one in the history of the nation, was most necessary. It was one of the principal ports of the Empire, and it would be much better if facilities of transport by rail, sea, river and road, with the prospect of aerial transport to follow, were properly co-ordinated. All of the big cities of this country, in his opinion, would be connected by aerial transport within the next 25 years, and at many of them there would be aerodromes; but without co-ordination, the sympathy, and the clear vision and foresight that were absolutely necessary in town planning, the results would not be all that they should be, particularly as they should be for the benefit of the country. In associating the name of Lord Montagu of Beaulieu with the toast, he would like to

Minestead Church.

Brockenhurst Church.

Former Church at Lyndhurst.

emphasise the great amount of attention and assistance his lordship had given to the transport question, especially to road transport. Lord Montagu had been associated with road transport since the inception of the Town-Planning Act, when the Road Board came into operation, and he had always been to the forefront in helping to forward anything that was for the good of the transport of the country.

Lord Montagu, in his reply to the toast, said he was going to say, first of all, how sorry he was that his friend Major Gilbert Szlumper was not able to be there that day, and also his friend Lord Apsley. He was going to have said a few complimentary words to Major Szlumper about the enterprise of the Southern Railway, which he thought they all acknowledged, in creating facilities of transport not only in Southampton but in a remarkable way in regard to the suburban service in South London. As the proposer of the toast had said so well, there was a very intimate connection between transport and town planning. In fact, if they went back to the earliest days, he supposed one might say that even when the early man lived in a cave he had to have some road leading to it. In that sense a road was an earlier human institution than even the most primitive of huts, but now a road was essential to any good town-planning scheme. As experts, he appealed to them to think in the future of the possibility of never putting up large congregations of human dwellings along the lines of roads which were likely to become main roads. It was quite clear if they thought ahead that the great main arteries of traffic were going to be like the great railway lines, in constant use night and day, and apparently used by heavier vehicles than were being used to-day. His idea was that they should make what they called the satellite towns outside great cities adjacent to but not on main roads. Another point he wished to put to them was to contrive, if possible, to build their residential streets away from the constant traffic and noise of the ordinary streets. There was another point which he would just like to bring to their notice. In London, and other big cities, the greatest difficulty in working properly had become the difficulty of moving about. The congestion of London, and even of far smaller cities, owing to the increase of traffic, was known to everyone, and he had come to the conclusion—he believed some of them would agree with him—that their cities were growing too big. If the present system was not altered in London, for instance, people would be forced to shop in the suburbs, their factories and various other businesses would be forced out from the central parts of those cities, and in his opinion it was a very good thing that that should happen. If they kept on increasing the facilities of transport into those great cities, the latter would expand and expand until eventually they would choke themselves. He would, therefore, rather see in the future a group of smaller suburbs surrounding a big city than see that big city increase either upwards or outwards.

At the conclusion of the luncheon proceedings, the party inspected the docks, at the kind invitation of the directors of the Southern Railway, where amongst other shipping the great "Leviathan" was watched entering port. The return journey to Winchester was then made, and the day's activities were concluded with a very cheery smoking concert, held in the Guildhall, by kind invitation of the Mayor and Mayoress, Councillor and Mrs. F. Webb-Manley, to whom, at the close of the evening, a hearty vote of thanks was accorded by the President and members.

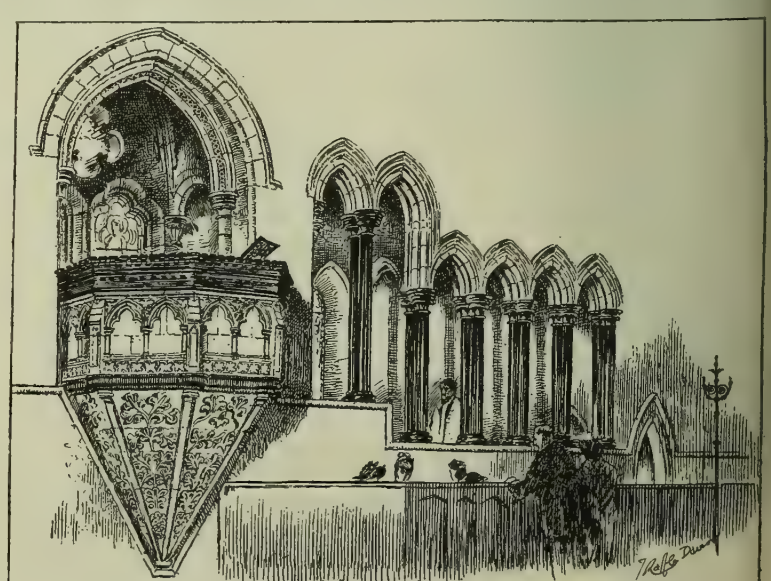
Saturday, October 8.

In the morning of this day the party met at the Royal Hotel, after which visits were paid to various places of interest in the city, including the Cathedral, Winchester College (whose Memorial Cloisters, the work of Sir Herbert Baker, A.R.A., were published in *The Builder* for July 1), and the Castle. In the afternoon the large housing scheme of the Winchester Corporation at Stanmore, designed by Mr. W. Curtis Green, A.R.A., F.R.I.B.A., was inspected, and a visit paid also to St. Cross. In the late afternoon a council meeting was held at the Guildhall.

Dinner at the Winchester Guildhall.

On Saturday evening the President, Mr. Montagu Harris, with Mrs. Harris, welcomed a large number of Winchester guests at the annual dinner, served in the banqueting hall of the Winchester Guildhall, and a company of about eighty sat down to dinner. The setting was an attractive one, as the room contains many interesting pictures, amongst the most famous being Lely's portrait of King Charles (the personal gift of the King to the City in the days of its prosperity), and the portrait of the Defender of Basing.

The guests included :—The Rt. Worshipful the Mayor of Winchester (Councillor F. Webb-Manley) and the Mayoress (Mrs. Manley), the Very Rev. W. H. Hutton, D.D., D.C.L. (Dean of Winchester), Canon A. G. Robinson and Mrs. Robinson, Alderman J. S. Furley (Chairman of the Winchester Town-Planning Advisory Committee) and Mrs. Furley, Alderman W. H. Forder (Chairman of the Winchester Corporation Housing Committee) and Mrs. Forder, who had kindly provided tea for the Institute when they visited the Stanmore Housing Estate during the afternoon, Alderman H. D. Johnson and Mrs. Johnson, Sir Charles and Lady Close, Mr. Henry White (Clerk of the Hursley Council who are co-operating in the Regional Town-Planning scheme of 51,557 acres) and



Lyndhurst.

Mrs. White, and Mr. Thomas Holt, O.I
(Town Clerk of Winchester) and Mrs. H

The Past Presidents, Vice-Presidents, other members of the Institute were pres

The President first gave the toast of Majesty the King, which was drunk musical honours. Rising again, the Presi proposed the toast, "Winchester." T was, he said, no new Winchester, and did not want a new Winchester; the Winchester was good enough for them, all its ancient glories and traditions. he would refer for a moment or two to s points on which the history of Winche and town-planning questions came into tact. It seemed to him that there scarcely a city in the world whose hist was more clearly written upon its face t the city of Winchester. If they looked upon the very origin of time—at any upon the origin of their race — what simple and beautiful monument could find than St. Catherines Hill, well known them at school as "Hills"? And he glad to observe that the custom which fallen into disuse in his time, of the sc processing periodically up "Hill," had been started afresh. He remembered well shock it was to him in his boyhood to the white gash which the new Great West Railway cut across the front of "Hil Time had softened that, and no longer the eye offended by the white streak th and one was happy to think that that wou

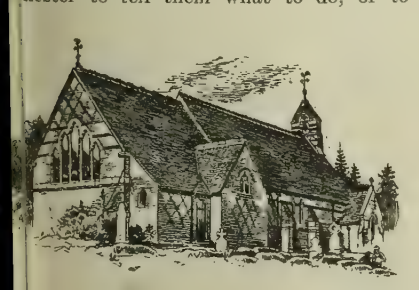
The Old Pulpit in Beaulieu Church.

monument of old time was now preserved ng to the fact that it was now scheduled ler the Historical Monuments Act. It ld be unthinkable that "Hills" should covered with villas or shops or anything hat kind, and one was delighted to feel t there at any rate was preserved one of most ancient physical records of their ient history. Referring to what had been e to preserve the many other treasures of nchester, the speaker said that happily y knew that the Town Council and the yor had been enlightened enough to take ry step it had been possible for them to e to preserve all the great treasures they received from the past. They had passed ir resolution to make a town-planning eme which they could now do for historic as, and that scheme to preserve the char- er of the built-up area of Winchester had eived the sanction of the Ministry of alti. Therefore he said that the vandalisa- n crimes of the eighteenth century they ght confidently hope might never be re- ted, and the action the Town Council had en to preserve their treasures was one they ed might be copied by every city in the ntry which could do the same thing. But nchester had not been so selfish as only take in its own borders, they had looked side and had realised what they could do regional planning in order to care for the ure development of the land surrounding city. Although he did not propose to go this in detail, he would refer to the py spirit in which they had been met by other authorities, the two rural district ncils concerned, who had come into the eme. That one was glad to see, for one not see it so often as could be wished— trust and confidence which there was be- en the various authorities as regarded this ortant question. That was a spirit which most highly to be commended, and that was one which they hoped would be ed in other parts of the country, where e existed a certain amount of jealousy ween various authorities which one was emely sorry to see—not only with regard regional planning and rural district coun- but one knew also with regard to the le town-planning scheme. The town ncil there had the strong support of those t bodies which owned so much land and uch of interest in antiquities—the Cathe- authorities and the College.

he Mayor (Councillor F. Webb Manley) it was Grant Allen, he believed, who responsible for writing that Hampshire the original nucleus of the British ire, and that from there sprang every- g that was connected with the great power he wide-flung Dominions of the King. refore, Hampshire being the centre, the eus, Winchester, as its capital, was still centre of the British Empire. And they had dignity with them, even if they no er had riches, wealth and power, and he lved that all residents in Winchester were d of their old city, and were only too ed that organisations such as the Town- ning Institute, who were interested in tiquities and beauties, should visit them.

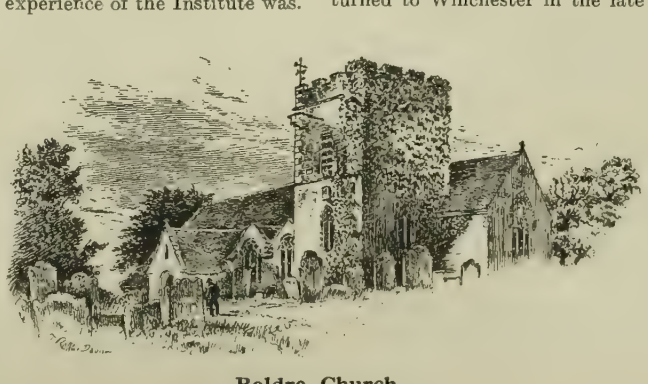
Ie Very Rev. the Dean of Winchester Hutton) said he was very much relieved ear that the Institute had not come to hester to tell them what to do, or to plan something more. As to Winchester's past, it was a glorious past. He thought it was the finest city in the Empire, the most historical, and it had done more for the Empire than almost any other.

Mr. T. Peirson Frank, M.Inst.C.E., Liverpool, next proposed "Success to Town Planning." The success of town planning, he said, was, of course, the aim and object and interest of members of that Institute. They had had an excellent object lesson, he said, in and around the city, of what they would like preserved, and what ought to be preserved, and he thought Winchester would have been bound to have adopted a town-planning scheme, not only for the city, but also for the region, because they had the preservation or protection of its magnificent architectural and artistic features. It would be a very great pity, indeed, if advantage were not taken of those powers which the Council now had of enforcing certain elements of town-planning legislation. They had seen in and around Winchester magnificent boulevards, but they were not so wide as they might be. He hoped Alderman Furley, when he was considering the question, would give particular consideration to means for transport. Winchester was situated very near a large seaport. He (the speaker) happened to have the honour of serving what was the largest seaport, and the traffic there was enormous, and if Southampton was going to grow as they had been assured it was, then they were going to be faced with a difficulty which had not yet become apparent. They might think the traffic conditions that day were serious, but personally he did not think they were one-tenth so serious of what they were going to be. In connection with by-pass roads, he could mention something of the enormous traffic they had to carry. They had over eleven million tons of traffic on one road at the present time out of Liverpool, and, further than that, they had commenced out of loans a roads programme for the Liverpool and East Lancashire roads, estimated to cost over £3,000,000. They had recently commenced the Liverpool portion. It had been put to him by a member of one of the Government staffs that this was a sound economic proposition, despite the figure, because the cost of upkeep of the present existing road between Liverpool and Manchester was so enormous. He believed they would find a ring road an economic feature. Town planning, in which they were all interested, was, he believed, founded on legislation which was the most beneficent Parliament had inaugurated in recent years.



Alderman J. S. Furley, chairman of the Winchester Regional Town-Planning Advisory Committee, in responding, said that all he heard about town-planning schemes was this: "You will be extremely lucky if you get it done in your lifetime." He trusted that might not be the case at Winchester. He thanked the Institute for coming to Winchester, and making it their centre this year. He could assure them it had been a great gain and a great pleasure to Winchester. He supposed he could not tell them anything about town planning, but he could tell them, possibly, a little about the conditions of Winchester, which might vary in some degree from what the experience of the Institute was. He did not mean to say that Winchester was unique among English towns, but it had a great many peculiar features of its own. Taking first the built-up area, what was the problem? They had interesting and beautiful buildings, and interesting and beautiful streets. Would they believe it that, one by one, many of the interesting features in Winchester streets had been frittered away? Past ages had been guilty of many pieces of mischief. He had had to point out at College some of the losses they had suffered from the ignorance of the past, and not many years ago a range of interesting fifteenth-century timbered buildings in Winchester disappeared. He was aware that town planning would not enable them to preserve all ancient buildings which still remained private property, and until such were scheduled under the Act they could not prevent their destruction, but they were promised power, in that they would be able to prevent alterations to old buildings, and still more, to prevent buildings being put up side by side with them of a totally unsuitable character. The Institute had been to Southampton, and on the morrow they were to go further into the Forest, and they would agree that they were here in a uniquely beautiful country; but what was happening to it? They all knew something of the rambling habit of building; how they got strung out along the roads long lines of houses; and it was no exaggeration to suppose that in 20 years time, if one started two miles from Winchester, one would probably find a continuous line of houses strung out all the way to Southampton. That meant a completely different configuration of a town. Instead of being circular or compact, it would be strung out in a long line along the roads, and let them think of all the evils that meant. How were they going to drain such towns? how supply them with water? and how supply education? He spoke feelingly on the latter point, as chairman of an Elementary Education Committee. This was where town planning should come in. He was not afraid of the bungalow. He thought the bungalow, being a low building in proportion to its length, was quite capable of being a beautiful building.

Mr. G. L. Pepler, F.S.I., Past President, said that was the first occasion when they had met with their new president, Mr. Montagu Harris, in the chair, and he felt the Institute would like to take the opportunity of drinking his health. It had been, he said, a particular pleasure to come to Winchester, as their President was an Old Wykehamist, and so saturated with Winchester tradition.



The President responded, and the proceedings terminated.

Sunday, October 9.

The Conference was concluded on this day with a char-à-banc tour through the New Forest. Romsey, Lyndhurst, Beaulieu (by kind invitation of Lord Montagu of Beaulieu), Lymington and Brockenhurst were amongst the places visited, the ruins of the Cistercian monastery and the church at Beaulieu occasioning much interest. Lunch and tea were taken at Lyndhurst, and the party re turned to Winchester in the late afternoon.

THE LONDON BUILDING ACTS AND THEIR APPLICATION—XXX

By H. V. MILNES EMERSON, A.R.I.B.A.

BY-LAWS—(*continued*).

Foundations and Sites of Buildings.

No house, building, or other erection shall be erected upon any site, or portion of any site, which shall have been filled up or covered with any material impregnated or mixed with any fæcal, animal or vegetable matter, or which shall have been filled up or covered with dust or slop or other refuse, or in or upon which any such matter or refuse shall have been deposited; unless or until such matter or refuse shall have been properly removed by excavation or otherwise from such site. Any holes caused by such excavation must, if not used for a basement or cellar, be filled in with hard brick or dry rubbish or concrete, or other suitable material, to be approved by the District Surveyor.

The site of every house or building shall be covered with a layer of good concrete, at least 6 in. thick, and smoothed on the upper surface.

The foundations of the walls of every house or building shall be formed of a bed of good concrete, not less than 9 in. thick, and projecting at least 4 in. on each side of the lowest course of footings of such walls. If the site be upon a natural bed of gravel, concrete may be omitted from the foundations of the walls with the approval of the District Surveyor.

The concrete must be composed of clean gravel, broken hard brick, properly burnt ballast, or other hard material, to be approved by the District Surveyor, well mixed with freshly burnt lime or cement in the proportions of one of lime to six, and one of cement to eight, of the other material.

Note.—The definition of foundation is given in Section 5, subsection 9, as follows:—The expression "foundation," applied to a wall having footings, means the solid ground or artificially formed support on which the footings of the wall rest, but in the case of a wall carried by a bressummer means such bressummer.

Section 65, dealing with chimney shafts, is the only case where the District Surveyor can insist upon the foundations being made to his satisfaction. The foundations to all other buildings come under the foregoing by-law, and providing the terms of this by-law are carried out, the District Surveyor cannot enforce other conditions. For instance, assuming the foundation is of firm earth, not hard clay, gravel, etc., or even to have been filled up with hard material, but sufficiently strong to carry the weight of the structure with safety, the District Surveyor cannot compel you to go down to what he considers a firmer or better foundation, as subsection 1 of the First Schedule only states that the walls and footings are to rest on the solid ground or upon concrete, or upon other solid substructure. If experience proves you right in your calculations that the foundation was sound, well and good; but if the foundation proved otherwise, and the structure began to settle, then the District Surveyor could, if he considered it advisable, serve a dangerous structure notice and have the walls underpinned to his satisfaction. It is, of course, essential that all foundations should be capable of carrying the structure with safety, but providing they fulfil this condition, such foundation will comply with the by-law and the Act.

It will be noticed that the aggregate of the concrete must be to the approval of the District Surveyor, but the strength or fitness of the lime or cement is not mentioned. Perhaps the standard specifications will be adopted in the new Building Act, when it arrives. The District Surveyor has also the power to sanction the omission of concrete to foundation upon a natural bed of gravel, but where a concrete bed is used he cannot enforce a greater thickness than 9 in.

Description and Quality of the Substances of Walls.

The external walls of every house, building, or other erection shall, except in the case of concrete buildings, be constructed of good, hard, sound, well-burnt bricks or of stone.

Similar bricks shall be used in the portions of party and cross walls below the surface or level of the ground and above the roof, including the chimney stacks. Cutters or malms may be used in arches over recesses and openings in, or for facings of, external walls.

Note.—Under this by-law hard bricks are to be used in external walls, etc., but any underburnt or soft brick can be used for internal walls.

It is a question if the sand lime brick can, under this by-law, be used for external walls even if covered with rough cast. Under the First Schedule walls are to be built of bricks not less than 8½ in. long, and the District Surveyor thus has the power of restricting the use of bats.

The walls must be built in horizontal courses with good mortar or good cement, the mortar composed of freshly burnt lime and clean sharp sand or grit, without earthy matter, in the proportions of one of lime to three of sand or grit.

The cement to be used must be Portland cement or other cement of equal quality to be approved by the District Surveyor, mixed with clean, sharp sand or grit in the proportions of one of cement to four of sand or grit. Burnt ballast or broken brick may be substituted for sand or grit, provided such material be properly mixed with lime in a mortar mill.

Note.—The word grit covers a multitude of sins in modern house construction, the builders seeming to have an idea that any material comes under this term, but most District Surveyors will allow a certain amount of loamy grit to be used with a given quantity of clean sand, its use tending to make the mortar fat and easier to work. A mortar composed of very clean sharp sand is often not so good, especially when used in hot weather.

The walls are evidently considered of more importance than concrete in foundations, as the cement used in walls is to be approved by the District Surveyor.

Every wall of a house or building shall have a dampcourse composed of materials impervious to moisture, to be approved by the District Surveyor at a level of not less than 6 in. below the level of the lowest floor. Every external wall . . . which abuts against the earth shall be protected by materials impervious to moisture to the satisfaction of the District Surveyor.

Note.—The power given to the District Surveyor to approve materials used in dampcourses prevented the use of tarred felt when this article was placed upon the market. Pliable dampcourse composed of canvas and bitumen of reputable make can be used, and is probably better than the old slate dampcourse, the slates being often broken in laying.

Whenever concrete is used in the construction of walls, the concrete shall be composed of Portland cement and of clean Thames or pit ballast or gravel, or broken brick or stone, or furnace clinkers, with clean sand, in the proportion of one of cement, two or sand, and three of coarse material to pass a 2 in. ring, to be mixed by measure with clean water.

The walls to be carried up regularly and in parallel frames of equal height, and the surface of the concrete filled in the fram be left rough to form key for next fram concrete.

Note.—The thicknesses of concrete are given in the first schedule of the Act must be one-third greater than walls bui brick, stone, or other hard and incombus substances laid in horizontal beds or cou If the concrete is made into regular sh blocks bedded in mortar or cement then thickness of the wall would be as for b

Concrete party-walls and chimney-st carried above the roofs of buildings mus rendered externally with Portland cen The thickness of the cement coat is not g and can therefore be simply a skinning

---

ENFRANCHISEMENT O COPYHOLD

The title of this work on its cover, "Har Copyholds," may cause surprise to that inv able person, "the man in the street," as he have heard of the convulsion that has t place in the "Law of Property" by the pas of six new Statutes, and may have been told copyholds are abolished and manorial ri extinguished. In these days the "old c changeth" very rapidly, but not quite so ra as that, for as the author states in his pre the Law of Property Act, 1922, "save manorial incidents which have any real v until the same are extinguished either by a ment or compulsorily" within a period of years, and even then allows a further five y during which the compensation for the man incidents can be ascertained. This referenc the Property Act, 1922, instead of to the solidating Act of 1925, requires some explana which will also be found in the pages of volume, for the consolidating Acts having re to the ultimate extinction of manorial ri did not repeal the Property Acts, 1922 and 1 so far as they relate to copyholds, and t Acts as well as the Copyhold Act, 1894, still to be consulted.

From what we have said it is apparent those concerned with copyholds and man rights have still to consult special statutes reference to the "Enfranchisement of Copyh and the Extinguishment of Manorial Incide the title of this work on the title page, and it be a great convenience to them to have relevant Statutes and Orders collected in handy volume of some 340 pages, apart from vast mass of legislation contained in the solidating Statutes, which have been the sub of many treatises which in that bulk have ha refer also to the Statutes which remain u pealed by those Acts.

The author appears to us to have perfor the task he set himself with thoroughness, the work contains an introduction, the te the Acts with notes, the Orders, and has a t of Statutes, a table of cases and an in Part V of the Property Act, 1922, enfranc copyholds (see section 128), but the follo manorial incidents are reserved from the op tion of that section, but are to be extingui on payment of compensation under Par (see section 138), (*a*) quit, chief, and similar rents or payments; (*b*) fines, re heriots and dues, including stewards' (*c*) forfeitures, other than forfeitures for conveyance of an estate of freehold, an alienation without license; (*d*) and right to timber. The subject is one of complication, but this volume so far a have been able to examine it appears to with it thoroughly and comprehensively an lucidly as the subject permits, and we thi will find a place in the libraries of all who to deal with the funeral rites of manors.

* "The Enfranchisement of Copyholds and the guishment of Manorial Incidents (under the Pr Acts, 1922 and 1924). By G. E. Hart, Sc (Honours), Steward of the Manors of Barkham, Net and Tarring Cameis, Sussex, etc. (London: Butte & Co.) 1926. 21s. net.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as widely as possible, or, better still, in typewriting?—Ed.

Nuisance Caused by Spring: Question of Responsibility.

[Reply to "G," September 30.]

Sir,—If the spring can be proved to be on, or issue from, the garden referred to, then the responsibility for the nuisance rests, in my case, with the occupier of the garden. The spring, it is stated, flows across the public footway; therefore it is a public nuisance, which may be remedied by (a) indictment, (b) information, or (c) abatement. In this case the local authority should serve a notice on the occupier, requiring the abatement of the nuisance. Under the Public Health Acts, an authority, it is bound to do this—if satisfied a nuisance exists; also, if the nuisance is not abated by the occupier, to do what is necessary itself; recovering from the occupier the cost of so doing.

It is not easy to suggest the best way of carrying out the work required without definite information as to the nature of the subsoil. In most instances, however, the water can be collected up by means of a system of sub-soil drainage, and if required for use, conveyed to, and stored in, an underground tank, or diverted to catch-pits and led to a ditch or natural watercourse. If the latter does not exist, or is too far away, then, with a suitable subsoil, as, for instance, chalk, it may be disposed of in the chalk by means of soakaways

Subsoil.

Road Construction.

[Reply to "Drysite," October 7.]

Sir,—The cost of making-up a road is nearly more where the level has to be made up appreciably to a higher level than where the bottoming is laid direct on the natural ground level. In laying out an estate, it is always desirable to settle the road level as near the average natural level as gradients and outfall of drainage will permit, and it is perfectly obvious that in the case quoted the 50 yds. of road adversely affected have had to conform to the average conditions. Sometimes it is impossible to dispose of surface drainage by clinging to the natural ground, and no doubt this is a case in point. It would be impossible to give a complete answer without having the whole of the conditions before us, but your correspondent may find the complete answer by considering these extraneous conditions in addition to those ruling the particular stretch of road in which he is interested.

Surely.

Concrete Blocks for Road-Making.

[Reply to "A. U.," October 7.]

Sir,—I was shown a system of concrete block road-making on a London housing site not long ago. It was of German origin, and, I thought, very economical and efficient. The blocks were circular, about 1 ft. thick, with small gusset blocks to fill in between the circles. The blocks were cast with holes running obliquely through them in such a way that when the blocks were laid on the ground in position, steel reinforcing rods could be driven in to interlace the whole together. The speed of laying was considerable, and a perfectly true surface obtainable.

If your correspondent is interested, I could give him have the name of the architects of the scheme, who, I feel sure, would give him authority to examine it. I am not in any way interested in the system.

Architect

Breeze Slab Work.

Sir,—Can you give me the price of breeze-slab laying at piecework per yard, builder of railings supplying all material?

W. F. B.

LABOUR AND "WEALTH"

The Labour Party at the recent Conference made a great parade of the discovery of a substitute for the capital levy in a surtax on unearned incomes of over £500 a year, in other words, an increase in income-tax on unearned incomes. Perhaps the most extraordinary feature of the debate was the ignorance, displayed by the mover of the resolution, of the results which would follow from it if ever it should be put into practice. He is reported as having said: "Income-tax at present came from earned and from unearned income. The former source was the worker, the Civil servant, the clerk; the latter was represented by the owners of securities, the drawers of rent, of interest on mortgages and investments; people of whom it might be said that their wealth came to them in their sleep without any necessity for work or personal exertion."

It is only surprising that any person who claimed to be awake could make such a statement. The drawer of rent is not necessarily a person who has used no personal exertion; he is very often a builder who, from small beginnings and care and forethought, has built houses and gradually attained some return for his labour. The Civil servant is not an apathetic member of the Labour Party but a man who, apart from any State aid, has been intent on raising his family and has accumulated a little capital by hard saving.

Then what is unearned income? Are the reserves built up by insurance and other companies to be placed in this category with the savings of the thrifty working or other person?

The eighty-five or one hundred million pounds thus extracted from the thrifty is to be devoted, according to the resolution, to the development of the social services and to the redemption of the Debt. The social services take first place in the resolution. In times of distress a Debt may prove less irksome than the finding of capital sums, and if industry is to be fostered, capital is required for that far more than for "social services," which may mean mere palliatives for a time of depression.

Capital and industrial peace are the crying needs of the moment in order to re-establish the nation on a sound economic basis, yet both are the constant subject for attack by the Labour Party, and it is somewhat significant that the schemes put forward by a "Labour" party never contain any suggestions for *making* money or capital, but are always directed to *taking* it from someone else.

This country provides more benefits to the working classes than any other country in the world, and immense sums are involved in the provision of these social services which relieve the working man from such provision for his family as amongst other classes has to be provided out of their personal savings. When wages are discussed the provision of these services out of taxation year by year is entirely lost sight of, and the social services increase hand in hand with wages.

The sums so dispensed are a burden on industry and indirectly prevent the increase in wages which otherwise could be provided, and this country is handicapped as regards other competitive countries. No one would wish to go backward, but in the abstract, and with the tendency of the present times, it may be questioned whether an excess of social services is not sapping the self-dependence of the nation, and whether, if the sums so spent had been available for a general increase in wages, leaving the working man to provide out of the increased wage some of the essentials for his family life, prices would not have been lower and the country more self-supporting and the spirit of self-dependence not so stifled.

It is a favourite argument with the Labour Party that high wages promote prosperity, but this argument seems lost sight of when it is proposed to reduce the spending power of persons with but £500 a year.

The social services do not stand alone; there are besides the enormous contributors to charitable societies and organisations, the loss of which would be severely felt should a Party come into power holding the views on capital now expressed by the Labour Party, who, with a steadily dwindling reserve of capital, would at last be driven even to curtail the social expenditure, and besides, leave the nation open to attack, from lack of capital with which to defend itself, in a national emergency such as the Great War.

L.C.C. HAMMERSMITH SCHOOL OF ARTS & CRAFTS

The advantage of training in drawing and craftsmanship generally, as an extension to ordinary education, cannot but effect a vast improvement on the average life of future generations, and at this important school we see it to be very intelligently given. In training the young to observe and record accurately, and by not mixing it up with the different order of faculty that goes to the making of an artist, the training given has all the more certain value, and for this reason the work of this school is of considerable importance. The exhibition bears witness to the generally good level of the work produced, and is in some ways an advance on last year's exhibition. There is less tendency to exploit the mannerisms of passing fashion, and more attempt to keep within the sensible limits of good drawing and design. This is all to the good, and sustains the belief in the value of the training to the ordinary life, and witnesses to the intelligence of the direction. There is really very little which calls for separate mention where the average is all so good, and one is almost bewildered by the amount of the work shown, which precludes reference to many single examples. We may note, however, among the water colours in the Junior Art Course (3rd year) the considerable skill shown; those by May Worth and P. Dimond being among the most successful. In the Junior Art Course (1st year), by day students, the water colours of feathers and flowers are very pleasant. The exhibition includes examples from many classes, among them drawing, painting, design and decoration, caligraphy, modelling, furniture, fashion and commercial drawing, etc. The drawing by S. J. Stokes of a sideboard and chairs in the furniture class has considerable merit. There is much to encourage the belief that a generation is growing up better trained to observe and record, and disciplined in character. This is of more importance to the ordinary life than any claims made for the encouragement of art. Art happens; if a nature of outstanding character develops out of such training, this is not the essence but the exception, though very much to be valued. It is an exception to the rule that the proper aim of these schools is to develop a higher average of attainment in the ordinary life. Much credit is due to the Principal and his assistants for so satisfactory a record, not the least part of which is an agreeable, happy atmosphere which pervades the work of the school.

Frauds on Builders.

Pleading "guilty" at Bishop Auckland recently to a series of frauds on building contractors in Durham, Northumberland and Lancashire, William John Westwood Dent, aged 51, South Shields, was sent to prison for six months with hard labour. Prosecuting on behalf of Messrs. J. Moore & Sons, building contractors, Shildon, Mr. W. H. Hope, of Sunderland, said that Dent sent out cards describing himself as a "Retained Building and Quantity Surveyor and Estimating Specialist." His plan of procedure was to represent that he had been retained to prepare bills of quantities for the erection of buildings, and he promised to send on quantities on payment of a deposit of £3 3s. Subsequently Dent wrote saying that he had been in financial difficulties and had used the money for his own use.

THE BUILDING TRADE

POINTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—I.

We have had occasion to notice from time to time the number of cases that still come before the Courts raising difficult points in connection with what might appear to be ordinary transactions between landlords and tenants, quite apart from the special complications introduced by such statutes as the Rent Restriction Acts or recent legislation, and in the following articles we propose to consider some of the questions which arise out of tenancy agreements in the light of decisions delivered in the Courts during about the last twenty years. For a comprehensive survey of the law of landlord and tenant a reference to some very old cases is necessary, but in these articles we intend so far as possible to limit our observations to points recently decided, and also to avoid subjects which have lately been treated upon in our columns.

When a man enters into a tenancy agreement or lease, there are many points which he has to consider. Firstly, there is the length of the term; secondly, the methods by which the term can either be prolonged or determined; thirdly, the liabilities he will be under during that term; fourthly, his rights during the term; and under these four headings it will be found that many complicated questions have to be considered.

What is usually considered the simplest form of tenancy is that by the year or from year to year, but possibly as many questions have arisen under such tenancies as under longer agreements or leases.

Tenancies may be described as of five kinds—(1) tenancies for parts of a year, (2) tenancies from year to year, (3) tenancies for terms of years under agreements or leases, (4) tenancies on sufferance, and (5) tenancies at will; but it will be hardly necessary to refer to classes 4 and 5 except incidentally, so we will commence with

Tenancies for Parts of a Year.

A tenancy may be weekly, monthly, quarterly, or half-yearly, but it appears that in each case it is well that the character of the tenancy or its duration should be expressly mentioned, for the mere fact that notice may be given within the year—that is, that the tenancy may be determined by a three months' or six months' notice—will not suffice to stamp a letting, where the rent is calculated by reference to the year, with the character of being a tenancy for less than a year. There are dicta in old cases contrary to this, but the decision of the Court of Appeal in the case King v. Eversfield (1897, 2 Q.B. 475) disposed of them. In that case under a written agreement dated October 22, 1886, certain land used as a market garden was let from September 29, 1886, "at the rent of £19 12s. a year, payable quarterly on the four usual quarter days," and it was agreed that the said tenancy might be determined "by either party giving to the other three calendar months' notice to quit, or of his intention of quitting, as the case may be, on any day of the year." On October 14th, 1896, the landlord gave the tenant notice to quit.

The question in the case arose in this way. The tenant claimed compensation for improvements under the Market Gardeners Compensation Act, 1895, and that Act applied only to lettings " . . . for a term of years . . . or from year to year," so the Court of Appeal had to determine whether this letting was a letting from year to year or for a term less than a year. The old cases we have mentioned above were cited to the Court, but the Court held that this tenancy agreement imported a tenancy from year to year, and the provision for the determination of the term did not cut this down to a quarterly tenancy, and the decision of the Court of Appeal in In re Threlfell (16 Ch. Div. 274) was relied upon, in which it was laid down that the parties to a tenancy from year to year are prohibited by no law or principle from agreeing that the tenancy may be determined on whatever notice they like to agree to.

In a later case, Lewis v. Baker (1906, 2 K.B. 599), by an agreement of tenancy, premises were let at a yearly rent of £70 "until such tenancy shall be determined as hereinafter mentioned," it being provided that it should be lawful for either party "to determine the tenancy by giving to the other of them three calendar months' notice in writing for that purpose," and the Court of Appeal held that the agreement created a yearly tenancy terminable by three months' notice, expiring with any year of the tenancy, and not a tenancy for an indefinite term, terminable by a three months' notice, expiring at any time.

In Dixon v. Bradford and District Railway Servants' Coal Supply Society (1904, 1 K.B. 444), where premises were let at an annual rent, "three months' notice on either side to terminate this agreement," a clause that the tenants should pay the rates and taxes was taken into consideration by a Divisional Court as pointing to a yearly tenancy.

From what we have said it is apparent that, when it is desired to create a tenancy for a period of less than one year, it is not advisable to specify the rent at the yearly rate, relying upon the length of notice specified to determine the term, but that the term for which it is intended the premises shall be held should be specified in the agreement, viz., a "weekly," "monthly," "quarterly" tenancy, and so on.

Notices to Quit.

This leads us to consider the character of the notice required to determine weekly and monthly tenancies. In the past there has been some doubt upon this subject, but recent cases have done much to settle such doubts. In Queen's Club Gardens Estate, Ltd., v. Bignell (1924, 1 K.B. 117; The Builder, June 20, 1924), by an agreement dated January 13, 1912, that being a Saturday, the upper part of certain premises were let "for the term of a weekly tenancy from January 13, 1912, at the yearly rent of £24 14s, payable by equal weekly payments of 9s. 6d. in advance." In passing we may point out that, although in this case there is a reference to the annual sum the rent would amount to, the agreement is specific that the tenancy is to be a "weekly tenancy." There were complications in the case, as the tenant was an employee, and also points under the Rent Restriction Acts were raised; but, shorn of these points, one of the questions decided by a Divisional Court was whether a notice to quit contained in a letter dated Friday, October 6, 1922, in the following terms, was valid:—"The Estate Company hereby give you the requisite week's notice for the termination of your tenancy one week from Monday next, on or before which date they will require vacant possession."

The Court considered the requisites for a good notice—firstly, what length of notice to quit a landlord must give to the tenant to quit in a weekly tenancy, and, secondly, when the notice must expire—and after referring to the uncertainty of the law on these questions as illustrated by cases ci in the text-books, held that in the case a weekly tenancy the notice must be week's notice, which must expire at end of a current week. Thus the notice this case was good as regards the len of time, but bad in that it did not exp at the end of a week.

In this case the Court had to consi the judgments delivered by another D sional Court in the case Simmons v. Cr ley (1922, 2 K.B. 95; The Builder, May 1922), which turned upon a monthly ancy, in which it had been held that that was required was a reasonable not and that a notice was not rendered reasonable from the fact that it expi on a different day from that on which tenancy began. The facts of that case w somewhat unusual, as it was a mont tenancy, commencing on the first of month and, the landlord being under impression that six months' notice was quired, gave a notice on March 15 to exp September 29. The Court, in Queen's Cl Gardens v. Bignell, very carefully c sidered this decision, and all the cases the point, and differed from the decis in a considered judgment. They fou that the judgments in Simmons v. Cross were founded on two Irish decisions, whi in their opinion, did not entirely supp the conclusions drawn from them, a although being only a Court of concurr jurisdiction, the Court could not overr that decision, yet it may be observed was not binding upon them as it rela to a monthly tenancy, whereas they w considering a weekly tenancy.

The case of a monthly tenancy, howev again came before a Divisional Court Precious v. Reedie (1924, 2 K.B. 149; T Builder, June 20, 1924). In that case tenancy had commenced on the first of month, and on September 5, 19 the tenant had received by post notice to quit dated September 1 in following terms:—"I hereby give you month's notice to quit, as I require house for occupation." The Court, foll ing the decision in Queen's Club Gard Estate v. Bignell, held that this notice ceived on September 5 was invalid, as a monthly tenancy the period of notice to quit must correspond with length of the tenancy, and must determ at the end of a periodic month from commencement of the tenancy. In this c the Court expressed the opinion that this respect no distinction could be dra between a weekly and a monthly tenar

The exact position as regards the auth ties is, therefore, as follows:—There is unchallenged decision of a Divisional Co as regards weekly tenancies (Queen's C Gardens Estate v. Bignell), but regards monthly tenancies some di gence of opinion between two D sional Courts (Simmons v. Cross and Precious v. Reedie), but in all th cases it was accepted by members of Courts that weekly and monthly tenan must in the above respects stand on same basis; so practically two Divisi Courts have differed from the decision Simmons v. Crossley. Until there is a cision of the Court of Appeal on question as regards monthly tenancies th is this degree of divergence in opinion tween two Courts of concurrent juris tion, but, having regard to the weight authority and the character of the ca we think it may be said definitely that point is decided and that the rule is rectly laid down as regards weekly te cies in Queen's Club Gardens Es v. Bignell, and as regards monthly te cies in Precious v. Reedie. There are o questions in connection with these no which we must defer to our next artic

THE TRADES' TRAINING SCHOOLS

Presentation of Prizes.

There was a very full attendance on nday evening last at the Carpenters' Hall, en Sir Robert Blair, M.A., LL.D., pre- ted the prizes to students of the Trades' ining Schools, and distributed the cer- cates, medals, etc., gained in the Carpen- s' Company's examination in carpentry. . F. Adams Smith, F.R.I.B.A., Master the Carpenters' Company, occupied the ir, and among those present were following :—Sir Banister Fletcher, R.I.B.A., Sir Percy Shepherd, Sir John vridi, Sir Harry Foster, Sir George mpton, R.A., Sir W. Goscombe John, A., Prof. R. Elsey Smith, F.R.I.B.A., E. Guy Dawber, A.R.A., Col. A. Preston, Col. Stanley Bird, and ssrs. F. Sutton, Walter Jacob, C. Robertson, P. Preston, W. Herbert ans, E. T. Pullein, W. J. Minn, J. rris Browne, H. Westbury Preston, J. tton Freeman, Charles Newson, L. W. istowe, C. A. Hindley, W. N. Watson, G. Montgomery, Arthur Beaford, Sydney ck, A. F. Mott, Horace Bird, J. Oliver reet, W. T. Plume, C. L. Hartwell, George rlby, Arthur Keen, F.R.I.B.A., Herbert . Wills, F.R.I.B.A., F. Halliburton Smith, R.I.B.A., G. J. Newson, F. W. Robson d W. Grellier, F.R.I.B.A.

Mr. Frederick Sutton, J.P., chairman of e Schools Committee, in the course of his nnual report, said that the number of udents for the new session enrolled to the esent date was 376, a good beginning. The tal number of students enrolled last session as 448, an increase of 26 on the previous ar. Attendances were most satisfactory. wo spacious and lofty rooms had been added their accommodation at Great Titchfield- reet to relieve the overcrowded condition the premises. The alterations had been rried out under the superintendence of Sir nister Fletcher. The speaker referred in mpathetic terms to the death last Novem- r of Mr. J. Dudley Forsyth, who was an per Warden of the Glaziers' Company, and a number of years had had charge of the aziers' class at the schools.

Sir Banister Fletcher, F.S.A., F.R.I.B.A., S.I., Director of the Schools, then read his ort on the Session 1926-27, in the course which he said the session was most success- , and the classes full to overflowing, so t, as in previous years, they had to resort waiting lists. Attendances for the session ched a total of 15,698, giving an average of .35 per evening, which was very satisfac- y. These figures showed the continued gress made notwithstanding the unsettled es, and the Worshipful Company of Car- ters, together with the Associated City panies, had every reason to feel proud their schools. The judging of the nerous exhibits of students' work took e on May 11 last, and the judges were h impressed with the high standard of k, some of which could be seen by the trations included in the annual report.

aving tendered his thanks to all who had perated in the work of the schools, the ker said the objects that the Carpenters' pany had in view in starting these schools ears ago were being abundantly realised y year. It was then resolved by the t that the resources of the Company ld be largely devoted to the technical ation of craftsmen belonging, not only he craft of carpentry, but also to the ling trades generally. This magnanimous prise was of national importance, as the pany had carried on those training ols at their own expense for all those years out taking a penny of public money in f the continuous cost. As time went on, City Companies expressed their wish to erate in maintaining classes in connection their crafts, and the Wheelwrights. ters, Tylers and Bricklayers, Glaziers, urers and Braziers, and Pewterers Com- s now carried on classes in the schools and had thus helped in the great work of technical education.

Their students were to be found not only in positions of trust and importance in Great Britain, but also in all parts of the Empire, so that the Carpenters' Company could take justifiable pride in the results of the work initiated so many years ago and efficiently carried out without a break ever since. While they carried on this work in their schools they always hoped that the old system of apprenticeship would never die out, for, in his opinion, it was the only sound way of learning a craft, especially when supplemented as it could be there in the schools.

Many of their students worked in machine shops during the day and supplemented this by hand-work in the schools in the evening, and thus obtained a twofold and intensive training for their future careers. These were eminently the days of machinery, not only machinery in building but also machinery at sea, machinery on the road, machinery triumphant in the air, and now we were even promised a mechanised army. They did not wish to belittle the use of machinery; they should, however, do well to remember that all machinery was itself the outcome of the free and independent initiative of the human brain directing the manipulations of the machine which was a substitute for the human hand. The machine was the product of human intelligence and was not itself intelligent, so when adaptability to special detail was required they must always have resort to hand-work which was directed by the intelligent brain of the actual worker. Thus hand-work will always continue hand in hand with machine work, and they must always maintain and train the skilled hand. This was the line along which Britain had held her place in the world. Those schools offered the opportunity to all their students to escape from the limiting influence of merely working the machines which others had invented; they gave the chance of practising original hand-work and it was from hand-working that all machines were developed — the machine was made in order to do rapidly, intensively, and accurately that which the hand did slowly, gradually, and sometimes even inaccurately. It was in the matter of accuracy, efficiency, and imagination that the character of the individual worker came in. Here again was the opportunity held out by those schools. The schools invited each student to develop his own character, to work along his own lines, and to put his character into his work. This it was that distinguished the hand-worker of olden times—no two bits of work might be alike and they might not even match, but they were the expression of the worker's character, and for this human reason they remained infinitely more alive than any machine-made products, however perfect in execution. They continued through all the ages to make the appeal of man to men. He calculated that some 12,000 individual students had passed through the schools since their foundation, and the Company could congratulate themselves that in their endeavours to improve technical education in this country they had reached such a large number of actual workmen.

In "a word to the students" the speaker said they had unique opportunities of improving themselves in their craft — a generous committee ready to provide all necessary plant and equipment, and instructors—while beyond all this they enjoyed an atmosphere of comradeship in endeavour which stimulated the mind and even strengthened the hand for work. If they wanted to get the greatest possible good from the schools they must resolve not to miss one single night when their class was open, for time was all too short and regularity of attendance was essential if the full benefit of the schools was to be secured. The old saw was still true that nothing succeeded like success, but success in these strenuous days only came to those who worked hard and were ready to seize the opportunities that offered themselves, and no really qualified craftsman was likely to be out of work.

Sir Robert Blair, having presented the prizes, delivered an address, in the course of which he referred to the valuable work which Mr. Sutton had done and was still doing for the schools. England was a country in which a great deal was done by voluntary service, and in their chairman of the Schools Committee they had voluntary service at its very highest point. During a recent inspection of the schools in the company of Mr. Sutton, he continued, he noticed an entire absence of machinery. It was very interesting for the craftsman to reflect that in spite of all that had been done to make machinery predominant in a mechanical age, craftsmanship still continued, and craftsmen could do without machinery. Another thing he noted in connection with the schools was that only five-eighths of the students came from the London County Council area. It said much for the schools that three students out of every eight came from the outer areas of London—from as far away as Gravesend and Harrow—and were willing to face the difficulties of travelling to the schools as well as the inconvenience of inclement weather. Each student was allowed to do individual work and must, he thought, get a good deal of gratification out of doing the thing which he wanted to do; the student did not so much work out the instructions of his master as the thoughts in his own mind, and it must be a tremendous inspiration to the student to work thus in close association with a great professional expert. Sir Banister Fletcher, in his report, had said that the schools were carrying on at their own expense. This meant that they got no assistance from the Board of Education, nor from the L.C.C. The Schools were established in 1893, and it was a matter of legitimate pride to the Carpenters' Company and the associated City Companies that they maintained themselves in a state of financial independance without any resources but their own. Having referred to the many colleges founded by the City Companies, the speaker said that seventy-five years ago this country began to get alarmed about industrial supremacy, and the cry was, "Give us a technical university." There were no means at that time of doing so. At that time the Government hardly knew what to do, and the City Companies got together and formed the City and Guilds of London Institute, and in 1881 laid the foundation of the first technical college. This was the Finsbury Technical College, which, with the Central Engineering College, gave England what had been needed for many years—a technical university. There was, indeed, a great record of work on the part of the City Companies in technical, secondary and university education. Having observed that there were 200,000 students of the type of those of the Trades' Training Schools at work in London at the evening schools, the speaker said that apprenticeship had more or less broken down, and they were trying to replace the old apprenticeship system by the help of technical education. The Trades Training Schools were financially independent, but they were not independent of the ideas that had come down during six centuries through the Carpenters' Company and associated bodies—ideas that had been modified by various events from age to age and by the stream of workmen who had come here from other countries. The many branches of the whole system of education were, indeed, interdependent.

Mr. Hindley, proposing a vote of thanks to Sir Robert, said the craftsmen could certainly do without machinery, but it was quite certain that machinery could not do without craftsmen, and that was one of the reasons why we must have technical schools.

The motion was seconded by Mr. H Westbury Preston, and carried with acclamation.

Mr. H. Greville Montgomery suitably pro-

posed a vote of thanks to the Chairman of the meeting, which was seconded by the Master of the Plasterers' Company, and carried.

Several interesting specimens of work by students of the Schools were on exhibition during the evening in the entrance hall of the building, and were examined with a good deal of interest at the close of the meeting.

NEW BUILDINGS IN LONDON

Bayswater.—School.—Subject to the approval of the Board of Education and to the modifications indicated by the Council's architect, the London County Council has passed the plans submitted by the managers of Bayswater Jewish school.

Clapham.—School.—The tender submitted by Messrs. A. E. Symes, Ltd., of Carpenters-road, Stratford, E.15, amounting to £35,706, has been accepted by the London County Council, for the erection of the new secondary school at South Lodge, Clapham. The plans have been prepared by Mr. G. Topham Forrest, F.R.I.B.A.

Dagenham.—Cinema.—Mr. Stanley Beard, of Baker-street, has prepared the plans for the new cinema which is being erected on the Dagenham estate. The building contract has been secured by Mr. H. Kent, of Beacon-road, S.E.

Dulwich. — Nurses' Home. — Tenders are being invited by the Southwark Board of Guardians for the erection of a nurses' home to contain 45 rooms, and also demonstration and lecture-rooms, general linen store, sewing-room, etc., at the Southwark Hospital, East Dulwich-grove. Messrs. A. Saxon Snell & Phillips, 9, Bentinck-street, Manchester-square, W.1, are the architects.

Finsbury-square.—Houses.—Messrs. Walter Lawrence & Sons, Ltd., have obtained the contract for the erection of the Royal London House, Finsbury-square, E.C. Mr. J. J. Joass, F.R.I.B.A., is the architect, and the quantities have been supplied by Mr. E. R. Babbs, F.S.I., of 40, St. James's-place, S.W.1. The price of the accepted tender is £371,731.

Golden-square.—Rebuilding.—Mr. S. Gordon, F.R.I.B.A., has designed the plans for the rebuilding of 37 and 38, Golden-square, 4-7, Upper James-street, and 34-38, Beak-street, W.1.

Golders Green.—Cinema.—The new cinema that is to be erected at the junction of Golders Green-road and Ambrose-avenue, Golders Green, will have seating accommodation for over 2,000 people. Mr. W. J. King, of 5, Great James-street, Bedford-row, W.C.1, is the architect. The building contract has not yet been let.

Greenwich.—School.—The London County Council has approved the finished drawings submitted by the managers of Our Lady of Grace R.C. school for a proposed new school.

Hackney.—Dwellings.—Ninety-two tenements are to be erected on a site at Shore estate, South Hackney, together with roads. The work is to be carried out by Messrs. Rowley Bros., Ltd., of Tottenham, at £39,890, for the London County Council.

Hackney.—Post Office.—A new post office and telephone exchange is to be erected at Hackney for H.M.O.W. The plans have been prepared by the Architects' Department of the H.M.O.W., and tenders are now being invited.

Hammersmith.—Cinema.—We understand that on a site at the corner of King's-street and St. Peter's-square, a scheme is being proposed for a new cinema. Messrs. Morton & Waters, of 310, King's-street, Hammersmith, are connected with the scheme.

Hereford-gardens. — Premises. — Messrs. Boodle, Hatfield & Co., of 53, Davies-street, W.1, have submitted plans which have been approved, to the Westminster City Council, for the erection of a building in Hereford-gardens, abutting upon Oxford-street, Park-street, and North-row.

Kingsway.—Rebuilding.—Messrs. Emden, Egan & Co., architects, 7, Garrick-street, W.C. 2, have prepared plans for the rebuilding of St. Clement Danes Vestry Hall for the St. Clement's Press, Ltd.

North Woolwich.—Baths.—New slipper baths are to be erected in Fernhill-street, North Woolwich, for the local council. Mr. J Sutcliffe, Borough Engineer and Surveyor to the Woolwich B.C., has prepared the plans.

Plaistow. — Extensions. — Messrs. Saxon Snell & Phillips, of 9, Bentinck-street, Manchester-square, W.1, are the architects for the extensions to St. Mary's Hospital, Plaistow. The contract for the scheme has been secured by Messrs. W. J. Maddison, Ltd., of Minories, E.C.1. The work is estimated to cost about £12,502.

Richmond.—Ice Rink.—An ice skating rink is to be built on the bank of the Thames, near Richmond Bridge. Mr. Sydney Clough, of 444, Strand, is the architect who has been commissioned to prepare the plans.

Rosebery-avenue.—Conversion.—The Sadler's Wells Theatre, in Rosebery-avenue, E.C., is to be converted. Messrs. Frank Matcham & Co., 9, Warwick-court, Holborn, are the architects for the scheme. The building contract has not yet been let.

St. Pancras. — Rebuilding. — The London County Council has the plans submitted by the managers of St. Aloysius R.C. School for the rebuilding of the school, which will provide accommodation for 312 boys.

Streatham Hill.—Cinema.—A new cinema is to be built on a prominent site at Streatham Hill. Accommodation will be provided for 3,500. The architects are Messrs. Sprague & Barton, 60, Haymarket, S.W.1. The quantities are now being prepared.

Woolwich.—School.—The London County Council has sanctioned the plans submitted by the promoters of the new R.C. school at Eltham, subject to the approval of the Board of Education.

Correction.

Mr. B. Yates, builder, of Fleet-street Saw Mills, St. Annes-on-Sea, is the accepted contractor for bank premises at Lytham, and not Messrs. Keenan & Yates, Ltd., as stated in our last issue.

BOOK REVIEW

Manufacture and Uses of Concrete Products and Cast Stone. By H. L. Childe. (London: Concrete Publications, Ltd.) Price 5s. net.

This attractively got up and handy volume of 256 pages and 160 illustrations has been written, we understand, in response to a widespread demand for a practical work covering all phases of the manufacture and use of pre-cast concrete goods, and there can be no doubt the demand has been adequately met. The volume deals comprehensively and in simple language with the subject, and will, no doubt, supply a want not only to architects and builders using pre-cast concrete and those engaged as specialists in the industry, but to those builders who make concrete goods a sideline. The essentials of selection of materials, grading and proportioning, mixing, curing, etc., are fully covered. All the generally used methods of surface treatment (and many new ones) are described and illustrated in colour and half-tone, and the methods of making coloured concrete are explained. Various surface textures are illustrated, and the methods of obtaining them described. The design and manufacture of moulds for all types of concrete products and all shapes of cast stone are dealt with at length, and descriptions of the best and simplest moulds for each type of product being illustrated by more than 50 working drawings and illustrations of moulds in wood, plaster, sand, glue, concrete, etc. Working drawings are given of moulds for columns, cornice posts, paving flags, kerb and channel, blocks and slabs, bricks, ridge and valley tiles, steps, sills, lintels, edging, balustrade, sundials, birdbaths, lettered panels, ornamental work, etc. Suitable proportions of cement and aggregate are given for all products.

THE NORTHERN POLY TECHNIC: SESSION 1927-2

We have lately received the prospectus fo the 1927-28 session of this School, whose d partment of architecture, surveying an building is under the control of Mr. T. Bennett, F.R.I.B.A., Hon.F.I.O.B., Ho F.I.B.D. There are three sections of th department—the senior day school, the juni day school, and lastly the evening schoo The senior day school is intended f students of either sex over 16 years of a about to enter the professions of architectur surveying, or the higher branches of th building industry. Prospective students the School of Architecture will be require to pass the School entrance examination produce evidence of having passed an a proved public examination before being a mitted. The Three Year Course of th School of Architecture is "recognised" b the Royal Institute of British Architect Students obtaining a first or second cla pass in the school examination are exempte from the R.I.B.A. Intermediate Examinatio The Junior Day School provides a thorou course of training for boys over 13 years age who propose to enter any of the craf connected with building, and enables them t acquire technical knowledge and skill as wel as to continue their ordinary education. Th Evening School provides facilities in eleme tary classes for those who have commence their career in offices or works, and in a vanced classes for those who have alread attended for the full day course or who hav otherwise acquired the groundwork of the training.

Full particulars of the courses are contain in the prospectus, which is obtainable, po free, from the Secretary, Holloway, N.7.

STRUCTURAL SCIENCE I MEDIÆVAL TIMES

Lecturing at the Central School of Arts an Crafts, on Wednesday, Sir Banister Fletche F.S.A., F.R.I.B.A., gave a graphic descri tion, illustrated by lantern views and model of the structural principles of Gothic cath drals, more especially in regard to the vaulting; their buttresses, to resist th thrust of such vaults; and their flying bu tresses to bring the pressures of the hig vaults down across intervening roofs to th outer edge of the buildings. These feature originally purely scientific in their purpos came to be designed in such a way as combine æsthetic values with the constru tive ones, and had thus thrown a mantle elaborate vaulting and framework over the mediæval churches. The weight of a buil ing was now, instead of being distribute over solid walls as in earlier periods, conce trated on isolated supports, thus leaving fr spaces for vast coloured windows. Only sm units of rough stone were now usually obtai able, in contrast with the large blocks Egyptian and Greek architecture, and th evolved a totally different method of co struction. Building thus became an expe mental science of effectively balancing sm stones on one another, producing a new pri ciple of lateral thrust and counter-thru The old Roman building stood solid on t ground; the Gothic structure soared light into the air with vaulted roofs borne aloft a great height by piers and buttresses.

The lecturer explained the evolution vaulting types, from the continuous bar vault like that of a tube railway tunn through the cross-vault to the type char teristic of mediæval work with "ribs" the intersection of the surfaces for grea strength, which deepened as time went leaving panels between which could be c structed very thin and light. He gave so interesting views of English and Fre cathedrals, including some shown looking wards, so that the vaulting could be m clearly understood.

The lecture on Wednesday, October 19, begin the study of Mediæval Architecture Italy.

(For rates of wages in the Building Trade in Scotland see page 599.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed, that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING ETC.

WILLESDEN.—U.D.C. instructed engineer to prepare plans for Neasden housing scheme.

A Bascular Bridge at Hull.

A new bascular bridge across the River Hull, to replace the existing North Bridge, is to form part of a large scheme of street improvement at Hull, and the Corporation Bridges Committee has accepted the tender of Widnes Foundry (1925), Ltd., amounting to £86,100, for its construction. The improvement scheme includes the acquisition of property and a diversion of road which is estimated to cost £300,000.

TRADE NEWS

Glass for all Purposes.

Messrs. James Clark & Sons, Ltd., of Blackfriars-road, S.E. 1, Bournemouth and Canterbury, have issued a most interesting catalogue describing and illustrating some of the styles of glass manufactured by them. The catalogue will be gladly sent upon application.

Change of Address.

We learn that the Valk Roofing Tiles, Ltd., have left St. Helen's-place and have moved to "Faxfield House," 28, Watling-street, London, E.C. 4. Telephone: City 0089.

Travelling Exhibit of Radiators.

The travelling exhibit of the National Radiator Co., Ltd., of Hull, fitted with a working installation of the "Ideal" Cookanheat and "Ideal" Classic Radiators, will demonstrate on October 17, 18, and 19, at the open space, bottom of Cambridge-road, St. John's-road, Huddersfield.

Hydrated Lime.

A party of the Swindon and District Building Trades Employers' Association visited the works of Thorold's Pure Lime and Hydrate Co., Ltd., at Ogbourne St. George on September 20. The party, conducted by Mr. J. E. Thorold, the Chairman of the Company, started by visiting the chalk face, where they saw the process of quarrying the chalk, which is then sent down to the works in skips. It is here stacked on flues to be dried, and taken as required to be loaded into kilns. The kilns in use at these works are fired by producer gas, which means that the chalk is burned into lime by a purely gas flame—no fuel over touches the chalk or lime at any stage of the process, and consequently the lime is perfectly pure—which result can never be obtained from kilns where the raw material and the fuel are burned together. After burning, which is done at a temperature of over 1,100 degrees Centigrade, the lime is cooled and taken to the hydrating shop. Here it is mixed with a scientifically determined quantity of water and vigorously stirred by a mechanical stirrer. Extreme heat is generated and the quicklime is converted into slaked lime or hydrate in the form of a very fine and pure white powder. But even then the process is not complete—for in case there should by chance be any particles which in any way have escaped complete slaking, the hydrate is taken by mchanical conveyors to a "lime dresser," which consists of a rotary screen of extremely fine mesh. All the hydrate has to pass this screen before it passes through into bins from which it is bagged ready for sale.

New Public Baths, Bermondsey.

The slipper baths, men's and women's, on the ground and first floor of these Baths are, we learn, formed with 1½ in. partitions, manufactured by Marbello, Limited, of Birmingham. They are composed of reinforced slabs, faced with this company's "Marmola," in this instance in a pale green colour. The material, however, can, we understand, be produced in almost any shade. A considerable saving in floor space is effected by the use of these slabs, which are 1½ in. thick. The flooring to the whole of these baths, also the promenade, etc., to the swimming baths, Russian baths, corridors, waiting rooms, etc., are in black and white patent "Durus Tiles," and manufactured and fixed complete by Marbello, Limited. They are laid in 8 in. square tiles, alternatively black and white. Those to the swimming baths, promenade, and surround to the Turkish plunge in rubbed tiles, the remainder are in plain surface tiles.

Imported Iron and Steel Wire, etc.: Board of Trade Announcement.

The Standing Committee (General Merchandise) appointed by the Board of Trade have reported on their inquiry as to whether imported iron and steel wire, wire nails, and wire staples should be required to bear an indication of origin. The reports will shortly be obtainable from the Stationery Office.

PATENTS

APPLICATIONS PUBLISHED.*

275,242.—S. L. Groom and Carrier Engineering Co., Ltd. : Apparatus for controlling the direction of the draught in an air conditioning or ventilating system.

274,291.—C. W. Glover and H. F. Smith : Construction of floors or ceilings.

274,378.—R. A. Ryves and M. E. Williams : Machines for making tiles, slabs and blocks.

274,946.—E. C. R Marks : Wood-carving machines.

274,955.—Colas Products, Ltd., and F. Ivy : Bituminous paints and like coating and impregnating compositions.

274,962.—W. J. Gibson : Building unit.

274,972.—A. Batchelor : Sheets and slabs for building purposes.

275,058.—Anglo-European Co., Ltd. : Method and device for the production of soft cable wood.

264,473.—Dr. C. Schantz : Process of and apparatus for preserving wood.

275,104.—Barton Foreign Patents, Ltd. : Manufacture of paving bricks and other ceramic products, and apparatus therefor.

275,685.—M. H. Tate : Production of floor, roof and wall coverings.

276,068.—A. S. Lewenstein : Floors and flooring blocks or units.

276,069.—A. H. Barnes and E. R. Hillier : In situ concrete building construction.

276,099.—E. Grieve : Securing-ties for hollow brick walls.

276,115.—F. Woolaway : Chimney-top or cowl.

276,173.—G. A. Evans and R. A. Fletcher : Pipe connections.

276,241.—H. P. Powell : Walls and partitions for buildings.

276,256.—A. C. M. Harris and W. Hemus : Glasshouses and hot-houses.

274,537.—A. Hanssens : Moulding of concrete and like blocks.

274,568.—C. W. I. Thomas : Door-holders for garage and other doors.

274,685.—Electro-Mechanical Brake Co., H., and S. Smith : Pipe joints.

All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Aberdeen.—Adaptation.—The Town Council has received a letter from Sir James Murray, of Buckingham-gate, London, chairman of its Art Gallery Committee, offering £10,000 for the purchase and adaptation of Gray's School of Art as an integral part of Aberdeen Art Gallery.

Edinburgh.—Buildings.—The Edinburgh Dean of Guild Court has sanctioned the following building work : The City—electric sub-station at Craiglockhart-drive ; Education Authority—gymnasium at Tynecastle School, M'Leod-street ; Mrs. Marion M'Laren—five houses at 74-82, Moira-terrace ; Mr. P. R. M'Laren—six garages at Moira-terrace-lane ; Mr. W. Orr—four double bungalows off Craigleith-road ; and Trustees of the Roman Catholic Church—hall at Upper Gray-street.

Edinburgh. — Cinema. — The foundation work in connection with the new Palace Cinema is now well advanced, and the steel construction contract has been passed to Messrs. Redpath, Brown & Co., Ltd. The architect is Mr. C. Mitchell, 2, Randolph-crescent.

Glasgow. — Extension. — The work connected with the proposed extension of the Alexandra Theatre, Waterloo-street, Glasgow, will shortly be started. The architects are Messrs. Burnett, Son & Dick, 289, St. Vincent's-street, Glasgow.

Inverness.—Infirmary.—Tenders have been accepted from contractors for the erection of three parts of the new Northern Infirmary.

Paisley.—Housing.—The Dean of Guild Court has granted a lining to the Corporation for the erection of 26 blocks, comprising 96 houses of three apartments, at Kelburne Oval.

Peterhead. — Housing. — The Peterhead Town Council has passed a resolution to erect more houses, and Mr. J. Dickie, Burgh Surveyor, is to prepare and submit a scheme to the Council.

St. Andrews.—Building.—The University Court has announced that an anonymous benefactor has given £100,000 to the University, and the money is to be spent on provision for beautifying the college chapel and other building work.

ROYAL FINE ART COMMISSION FOR SCOTLAND

The first meeting of the Royal Fine Art Commission for Scotland was held in Edinburgh. The Commission, which is under the chairmanship of Sir John Stirling-Maxwell, has been appointed to inquire into such matters of amenity or of artistic importance relating to Scotland as may be referred to them by Departments of State, public or quasi-public bodies. At this meeting the scope and possible activities of the Commission were under consideration, and a general outline of the procedure to be adopted was arrived at. Meetings will be held at regular intervals, or special meetings called to deal with affairs which require immediate attention. Through permission of the Board of Trustees, it has been arranged that the meetings will be held at the National Gallery, Edinburgh, where the offices of the Commission will be situated.

Obituary.

The death has occurred of Mr. Joseph Shirras, of 127, Clifton-road, Aberdeen. Mr. Shirras, who was 74 years of age, was one of the most prominent men in the building trade in Aberdeen. He was the senior member of Joseph Shirras & Son, builders and contractors, 24, Powis-terrace.

The death has occurred, at the age of 67, of Mr. Thomas Anderson, builder, of 71, Willowbrae-avenue, Edinburgh.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers—Masons', Bricklayers', Plasterers'.

CXXXIII. No. 4420. OCTOBER 21, 1927.

DESIGN IN EVERYDAY LIFE AND THINGS.*

UNDER this title appears the year-book of the Design and Industries Association. It is a provocative publication for the simple reason that it challenges our attention year by year. Most of us have our theories worked out at some time or other, and either we forget them, or them quietly to rest. So many of them are born before their (we think) and there is no hope of seeing them put into practice. D.I.A. forces us to realise a distinction between thinking about bject, and keeping on thinking about it.

ithin the compass of a book-review this year-book would not into place easily. The D.I.A. represents certain beliefs and iples, and maintains them consistently. These beliefs are amental, and for that reason they throw out a challenge which ntinually being accepted. Briefly, the gospel of the D.I.A. s as a boon to those who have been compelled to have bad ecause they could not afford the price of the handicrafts-man. thers, the gospel is merely one that meets the devil half-way; will have nothing to do with the machine or any of its works. n this question it is worth bearing in mind that it is easy to e ordinary folks for their poor taste in surrounding themselves tawdry and vulgar articles. If they are not to accept machinery factor in modern production, they must be told that furniture instance—is so expensive to produce that it is out of the reach but a limited circle of wealthy people. Left in this position heap and nasty is free to flourish.

great deal of stimulating thought arises from a reading of the s in this book. This is inevitable when beauty comes under the ol of clear thinking. Logic by itself may not have inspired any art, but it is a very healthy beginning to work upon. For years ve been slaves to words and clichés, until it has become almost sible to state a simple opinion upon this subject without a long nation of our philosophy. Where commercialism is supposed the result of hard facts and economics, art, we imagine by nce, is produced regardless of thought or conditions. This ent can be inverted and supported with a measure of truth. are developments of the commercial mind so feeble and ugly they are opposed to common sense. Cause and effect may not ite so obvious; nevertheless, we are inclined to believe that mmercial mind shows its lapses from common sense when it foul of æsthetics.

itness for Purpose" is the slogan adopted by the D.I.A. It ents a principle believed to be at the root of enduring beauty. roposition that a thing shall be fit for its purpose is closely ed by two others—that its design shall be suitable for the ial of which the thing is made, and that it shall also be suitable e tools which are to make it. In fairness it should be said he D.I.A. does not believe that these propositions will ensure d beautiful design, but it does believe that through them a mprovement in design may readily be made. And on this we are in entire agreement. It is easy to pick holes in any tful scheme designed to capture beauty, and the easiest method set up metaphysical arguments upon beauty and utility. one, we imagine, would agree up to a point with those who have to prove that beauty may have nothing to do with utility. unately, in mixing up efficiency with abstract qualities they that there are occasions when efficiency is regarded as an al. Consequently, if beauty refuses to follow, it must be left . The average man has his own conception of utility, and erm it physical utility we come fairly near to his meaning. es not deny the usefulness of pictures or what he terms nents," but in his philosophy of usefulness he can find no for the ugly article that has no functional reason for its ce. On the other hand, there are all the makings of a pretty nt in assessing the value of a beautiful article that has failed unctional and remained to be an ornament.

things are obvious to the observant: (1) a large proportion functional ornaments in our houses is both ugly and silly; facility of the machine has been responsible for the profusion of cheap purposeless ornament tacked on to functional articles. It may not be common knowledge that the elaborate moulding covers a multitude of cabinet maker's sins, and that plain straightforward work requires more careful workmanship. The beauty introduced by the machine into many homes is proof that it need have no relation to utility. An honest piece of work postulates an honest point of view, and the theory of fitness for purpose, where it means the elimination of the unnecessary, compels us to retrace our steps towards honest construction. The insistence, therefore, on the need for functional fitness seems to run concurrently with the desire to achieve a measure of beauty by sheer simplicity of form.

This is obviously an incomplete philosophy, but it is not a negative philosophy. A thing may be functionally fit, yet ugly; conversely a thing may be beautiful, yet fail to meet the purpose for which it was designed. The danger lies in overstressing these statements. They do not indicate the operations of cause and effect when we know that there are a number of things that fail on both counts, just as there are others that satisfy completely. We seek for an explanation why so much sound old furniture of the plain farmhouse type has found its way to the houses of a wealthier class, leaving the cottages and farmhouses to be replenished with the worst efforts of the machine. This is a favourite theme of essayists who do no more than lament the tragedy of the cottager cheated into worshipping false gods and oak stain. It is not a complete answer that old furniture was made by hand, nor is it a fair answer that the measure of our purchasing power makes us responsible for driving out beauty through efficiency.

In an imperfect world the practical intention of the D.I.A. cannot be denied. It begins with the conviction that the machine can be controlled to produce things that may be both pleasing and within the reach of people with moderate means. Granted the conviction there remains the point of attack. In choosing "fitness for purpose" as a first principle, the D.I.A. has eliminated many of the weeds that flourish easily. If beauty is not to be won in this way it is at least assured of a fertile ground.

It is the popular connotation that a desire to control the machine is to deny the work of the craftsman. It represents a cardinal error. The personal touch of the master craftsman will always have its admirers, and as Mr. Roger Fry pertinently points out, "its rarity is part of its value to almost any owner." The problem at issue is whether to produce large quantities of objects at low prices for poor people, or whether to sell small quantities at high prices to rich. Or to put it otherwise, it is really a question whether cheap and poor art must be the lot of those who normally desire to possess certain things. Metaphysical arguments upon beauty leave us unimpressed in face of what seems to be both a practical and a social issue.

The problem of the machine develops easily into the problem of mending or ending industrialism, and our whole social system. This is to enter into a long and vexatious argument. Many of us would like to return to a much simpler social structure, believing we would find it a sanctuary of living native art. Nevertheless, it is a social development of considerable importance that the poorer people have been able to provide themselves with necessities that at one time were regarded as luxuries. Unfortunately for us and the world in general, shoddy materials and shoddy workmanship have come with machinery, and it is with these developments that we are here concerned. The point that seems to us to be so often overlooked is that when we have said our worst about machinery we are forced to realise that the evils that have come with machinery are not because the machine is inherently wasteful or fraudulent, but because our social order has not been adapted to its use. In other words, it is the human element that has failed, and it is the human element that the D.I.A. is attempting to guide.

NOTES

"Revived" Gothic.

The letters appearing in a contemporary on this subject re-affirm what has been often referred to in these columns on the subject of the "weary, silly routine" of revived Gothic. But when we are asked, so rightly, to abandon the mediæval legend, why not equally abandon the classical one? Is classical legend less a weariness to the flesh than the mediæval unless we suffer less from the former that we do not claim the same sanctity for it! And is not the Palladian legend equally one of these survivals? It appears to us easier to denounce this old routine than to point the way to a vernacular art of architecture which shall be the best expression of our own time. And it can only be so when our aims include the finest aspirations, which belong to all time. For a vernacular art cannot be reached consciously, but grows out of the national character, and is its flower. Meanwhile, we have to do what we can. There is doubtless no inherent sanctity to-day in Gothic architecture, though it once possessed that sanctity in full measure, and it is only when life is shaped by eternal values that it puts on the noble form which belongs to all great periods. Nor is this to be found outside of ourselves, or self-consciously. It is within us that the remedy lies. Let any one visit Rheims to-day or some of the latest developments of French architecture and then say whether there lies in it a vernacular feeling, uniting it with the spirit of all noble art, whether classic or mediæval. We do not yet believe enough in ourselves to enable us to do so, yet the foundations are being laid—more in thought than action at present—when the grip of circumstances and economic domination will yield to the spirit of man as he rises again above it. Then will architecture announce this better interpretation of life in the loveliness of its new forms.

Architecture and Life.

We need not be too complacent that the old forms of architecture can communicate so little perfume to our own work to-day. In some ways it would be better did we not take it quite so lightly, that the past is in so many ways little but a legend to us. The tragedy lies in its having become a dead language to architecture; that we are so far away from it, separated by more than the years. Yet no subtlest alchemy can perpetuate what has ceased to live. It has to be born again out of the beliefs which our extended knowledge imposes on us, with all their enlarged responsibilities. If the birth of a new epoch such as we move in to-day severs us further from the old, other than as when age succeeds to age, there is the promise of the new spring time to inspire us. There was never a time when it was more important to look forward. Architecture informed with the better conceptions of life and endeavour which stir within us we need feel no fear of adherence to "the silly routine" of revived Gothic, or to the subjectiveness that asserts itself in exaggerated individualism.

Oxford and Gothic Art.

That anyone who has read Sir Charles Mallet's appreciation in the *Times* of architecture in Oxford, both old and new, should have felt it would have been a timely and useful opportunity for him to point out the drawbacks of Gothic art seems a little odd. The excuse is, of course, the probably needless clearing away of old examples of later Renaissance and Georgian work, for in this kind of design the critic sees a sanity and charm which are impossible in modern work when Gothic work is imitated or revived. We note here again the mistaken accent on revival and restoration. In the largest quantity of modern Gothic we see little of the real spirit and quality of the ancient work, but it is too readily forgotten that some of our modern architects, some of wh are still living, have produced new w which is instinct with the spirit of old and, in some instances, have obtai a unity and breadth which were o lacking in the earlier times, bes adding a sense of refinement and tinction which makes a good deal of older work look archaic or haphaz However, we are witnessing stres times for the Christian church, and fine typical architecture which suits modern spirit less than the Pagan which on the whole goes indiffere well with the worship of the dollar.

Building Offences.

We believe there are a g many folk in close sympa with our correspondent, Bailey, who writes to u week in support of crusade against the widespread spolia of our beautiful country places. criticism of the bad colour so often fo is a just one, but it is to be remembe that time and tone work wonders w the colour effects, and often lar obliterate their crudity, whilst bad fo and proportion are things we ca cure. We have in mind now a hou scheme of appalling cottages, both a the crudity of colour and glaring ugli of form, which has been carried out the beautiful Cotswold country by, believe, a public body. We think s improvement may be hoped for as pu authorities gradually realise their res sibility for the preservation of l amenities, but for the improvement the average private cottage or bunga we fear we shall have a long tim wait, for we have nothing amongst nowadays such as that almost unive instinct which gave us Tudor, Qu Anne, or Georgian cottages. These w built doubtless in numberless cases wh no professional architect was emplo but were the offspring of a traditi instinct which made English cottages small country homes the most pleas buildings of their kind in the world.

Flats for Civil Servants.

An interesting experim in land development housing is now being car out in Clapham. Here on old estate, formerly a pa on a terrace of the old river bank, s thousand flats are being built, designe accordance with plans prepared Mr. Louis de Soissons and his part Mr. Grey Wornum. The buildings being erected by a Public Utility Soc known as "the Larkhall Estate, Li This owes its origin to a conversat between an official of the Ministry Sir Theodore Chambers, the Chairma the Welwyn Garden City, and of the Re Tribunal at the Ministry of Health. question arose as to the possibility providing houses actually within City of Westminster at a rent which c servants or clerks in city offices co afford to pay. Negotiations with exist tenants were entered into to obt vacant possession of their houses, and

Prague.

Thomas à Becket's Cottages, West Tarring, Sussex.
[These cottages have been purchased for the Nation.]

Easter it is expected that some flats will be available, and two n courts completed. Most of the have been planned as maisonettes heir own internal staircases. There hree-, four- and five-roomed flats, with its own kitchen, scullery and oom, and in each considerable ions in size, planning and aspect. arly every case the living rooms a south or a west aspect, while the n and bathrooms look east and Although surrounded by traffic , the estate is extremely quiet. of the blocks will face back and on to the garden courts, which are et as college quadrangles.

Wood ration ath.

The arrangements for the John Wood Bi-Centenary Celebration at Bath on Tuesday, November 1, are now practically complete. After on at the Guildhall, where the of Bath, Alderman Cedric Chivers, ertaining the chief guests, motor vill be in readiness to convey all attending the celebration round o view some of the principal works e great Georgian architect and r of town planning, including Prior the great mansion he built on the rts of Bath for Ralph Allen, whose ss capacity and generous patronage Wood's work possible. The tour e under the guidance of Mr. Mow- . Green, F.R.I.B.A., author of the rd work on "The Eighteenth y Architecture of Bath." The ent of the Royal Institute of Architects will place a laurel on John Wood's house, No. 24, square. The Celebration Meeting will then be held at the Pump Room, where speeches will be delivered by Sir H. Kingsley Wood, M.P., Parliamentary Secretary to the Ministry of Health, the Earl of Crawford and Balcarres, K.T., F.R.S., Hon. F.R.I.B.A., and Mr. Walter Tapper, A.R.A., President of the Royal Institute of British Architects. After the meeting an exhibition will be opened of original drawings by John Wood, old prints, documents and various objects of interest relating to his work. An influential Advisory Committee is assisting in the collection of material for the museum and in the general organisation of the celebration. Interest in civic architecture and town planning is not confined to professional architects, and a wide interest is being shown in the celebration. Special railway facilities from London have been granted by the Great Western Railway, and all particulars may be obtained from Mr. John Hatton, the Pump Room, Bath, Hon. Secretary to the Celebration Committee.

The Bridges Delay.

Lord Lee of Fareham is quite justified in his criticism of the delay which the problem of the three central London bridges is still encountering. He writes of Charing Cross, Waterloo, and Ludgate bridges, which constituted the pivotal and fundamental feature of the Royal Commission scheme. He says: "So far as I am aware, nothing whatever has yet been done to restore Waterloo Bridge, while the committee of engineers which is examining the Charing Cross scheme was not appointed till three months ago, and is not expected to report for some months yet."

The Late Mr. George Northover.

It is with deep regret we learn of the death of Mr. George Northover, who was associated with the R.I.B.A. in an official capacity for more than twenty-eight years. Mr. Northover retired in 1921, when he was the recipient of a testimonial expressing the great appreciation of members of the Institute for his long and devoted services to the *Journal*, and to the R.I.B.A. generally. At the time of the war, during Mr. MacAlister's absence, much of the burden of the Secretaryship fell upon his shoulders. In spite of the difficulties of that period, he discharged his duties in a manner that earned the admiration of all, and we can testify to his unfailing courtesy and helpfulness. After his retirement he frequently attended the meetings of the Institute, and received a ready welcome from his many old friends.

Entrance Gates, Schönbrunn, Vienna.

GENERAL NEWS

An Appointment.

Sir William James Larke, K.B.E., has been appointed by Order of Council, dated October 5, 1927, to be a member of the Advisory Council to the Committee of the Privy Council for Scientific and Industrial Research.

An Archæologist's Estate.

Mr. William James Knowles, 95, of Glenalla, Ballycastle, Co. Antrim, retired land agent and secretary, and a well-known archæologist and anthropologist, left £5,913.

Ken Wood Estate.

It is announced, says the *Morning Post*, that the remaining 74 acres of the Ken Wood Estate, Hampstead, will be passed to the public under the terms of the will of the late Earl of Iveagh.

Marlborough House.

We understand that a new entrance and doorway are to be given—under the direction of H.M. Office of Works—to Marlborough House, S.W.1. Marlborough House—one of Wren's largest domestic works—is to be the new residence of H.R.H. the Prince of Wales.

American Offer for Church Altar Rejected.

The parishioners of East Dereham, Norfolk, have rejected by a large majority a proposal to accept the offer from America to buy for £1,000 the 500-year-old chest, once the property of the Dukes of Norfolk, who stored their valuables in it. Given to the church in 1786, it has been used as an altar.

An Historic Building, Bolton.

The work of demolishing the old mill in St. Edmund's-street, where Samuel Crompton first began to spin cotton as a commercial project, was started recently. The old wooden hoist wheel, which has been in the attic since the days when Crompton used it, is to be offered to Chadwick Museum.

Proposed New Bridge at Middlesbrough.

Alternative schemes submitted by engineers appointed by the Durham County Council and the Middlesbrough Corporation provide for a new bridge over the river Tees at Newport, with a clear way for traffic of 200 ft., at a cost of £470,000, or one with a clear way of 325 ft., at a cost of £585,000.

Art Curators.

The recent death of Sir Whitworth Wallis, Keeper of the Birmingham Art Gallery, has brought about changes in the curatorship of other provincial galleries. His post has been given to Mr. Kaines Smith, who is succeeded at the Leeds Art Gallery by Mr. Frank Lambert, from the Stoke-on-Trent museums, which now have Mr. H. W. Maxwell as their curator.

College Residence, Paris.

Mr. Edward Warren, F.R.I.B.A., who had been invited by Lord Crewe, the president of the British Institute in Paris, to act as the architect for the proposed College of Residence at the Cité Universitaire, was unanimously selected as architect at a meeting on Tuesday at the registered offices of the Institute in Old Bond-street.

Derwent Wood Memorial.

Application has been made to the London County Council by the Chelsea Arts Club for permission to erect a memorial to the late Francis Derwent Wood, R.A., on a site in Chelsea Embankment Gardens, near Albert Bridge. It is proposed that the memorial shall consist of a small bronze group, the work of Derwent Wood, surmounting a stone pedestal containing an inscription plate in bronze. We understand that the Local Government Committee recommend that the club's request should be granted, subject to the usual conditions.

New Buildings at Corpus, Oxford.

A new block of buildings is in course of erection at Corpus Christi College, Oxford, under the direction of Mr. T. H. Hughes, of Glasgow. It will extend along the grove from the Gentlemen Commoners' building to Merton-street. Ten sets of rooms will be provided on two floors above the ground, and there will be a basement, with baths, underground. The outhouses of the back quadrangle will disappear, and the north face of the kitchen, with its fifteenth-century door and chimney, will be shown again. The building, says the *Times*, which will be of Clipsham stone, will be slightly L-shaped; its breadth will be greater at the street end than farther back.

The Physick Well at Barnet.

The historical interest attaching to the Physick Well at Barnet, the waters of which were drunk by Samuel Pepys in the years after the discovery of their tonic qualities in 1650, is to be perpetuated by a new brick structure with fountains, appropriate garden walks and flower beds, and two approaches to be named Well-road and Pepys-crescent. The project is in the hands of the Barnet Urban District Council, who are carrying out the wishes of many local societies and historians, and notably the Barnet Records Society. The well is situated near the town, in association with the Wellhouse Estate, which is being developed for some 180 dwellings.

The Architecture of Electricity Transmission Towers.

The Central Electricity Board have appointed Sir Reginald Blomfield, R.A., to advise them on questions arising in connection with the design and colouring of the towers for carrying transmission lines. The new steel towers carrying the overhead electricity lines which, under the schemes of the Board, will shortly spring up all over England, are to be made as artistically pleasing as possible. The Board believe that the towers may be constructed with graceful proportions and well-balanced lines so as to be attractive to the eye. According to the *Morning Post* they will probably be of different colours in different districts, to tone with their backgrounds. Hundreds of designs have been considered by the Board, and a model tower is in existence. The general effect resembles a miniature Eiffel Tower.

Stonehenge Appeal.

An appeal for £25,000 to save Stonehenge for the nation has been issued by the National Trust. The appeal is signed by the Prime Minister, the Earl of Crawford and Balcarres, Viscount Grey of Fallodon, and Sir Lionel Earle. Sufficient donations have been received, so it is understood, to enable the Committee to complete the purchase of the existing derelict aerodromes, hutments, and other unsightly buildings to the south and west of Stonehenge, and the purchasing contractors have given a guarantee that the land shall be cleared and made good within a year. It is now necessary to purchase some 1,200 acres of land on the northern and eastern sides of Stonehenge. Donations should be sent to the Secretary, the National Trust, 7, Buckingham Palace-gardens, S.W.1.

The Herefordshire General Hospital.

At a meeting of the Board of Management of the Herefordshire General Hospital it was resolved that a sum not exceeding £500 should be expended in making an appeal to the public for subscriptions towards the fund for extending and improving the buildings and equipment of the hospital. The scheme is to cost about £50,000, of which the greater part will be provided by the sale of invested securities, and the public will be asked for £20,000. It will be remembered that early in March of this year the assessor of the competition for these buildings, Mr. Charles E. Elcock, awarded the first premium of £150 to Messrs. Adams, Holden & Pearson.

COMPETITION NEW

Senior School, Birkdale, Southport.

The Education Committee have appoin Professor S. D. Adshead, F.R.I.B.A., to as assessor and adviser in this competitio

Manchester Town Hall Competition.

By a vote of 62 to 42 the Manchester Council have refused, until a full estimate costs has been prepared, to proceed wit scheme to enlarge the Town Hall. The ex sion was to cost about £1,000,000, and Manchester Retail Traders' Association, i formal protest read to the Council, decla that "to undertake such a work while tr is in such a deplorable condition would unjustifiable waste."

The Alexander Thomson Travelling Studentship.

The competition for this Studentship open to students of architecture between ages of 19 and 28 years, residing in the Uni Kingdom and Southern Ireland. Copies the conditions may be obtained on appli tion to Mr. William MacLean, Secreta Glasgow Institute of Architects, 21, W George-street, Glasgow, C.2.

Competition for Concrete House Designs.

In co-operation with the *Daily Mail* Id Home Exhibition, the directors of the Po land Cement Selling and Distributing C Ltd., have decided to open a competition which £1,000 in prizes is offered to arc tects for designs for concrete houses. T object of the competition is to gain a wid public recognition for the advantages of co crete in architecture, and to show by practic results the use of cement concrete as economic factor, applicable to buildings architectural character. It is felt that t competition will be a practical means of co veying to the general public a full realisati of what the architect can achieve in th material. By arrangement with the *Dai Mail*, the prize-winning houses will be erect and be on exhibition—completely furnish and equipped—at the Ideal Home Exhibitio at Olympia, in March, 1928. The Preside of the R.I.B.A. has appointed the followi assessors: — Messrs. Maxwell Ayrto F.R.I.B.A., W. E. Riley, F.R.I.B.A Douglas G. Tanner (Douglas G. Tanner Arthur L. Horsburgh), and Baker & Mallet quantity surveyors. There will be two se tions of the competition, "A" and "B the prize awards in each being:—First priz £250; second prize, £150; third prize, £10 In Section "A," designs for a house in co crete costing £1,750 are called for; and Section "B," for a house in concrete costi £750. Any questions must be addressed the Secretary, Concrete Houses Competitio Ship House, 20, Buckingham-gate, Londo S.W.1, and must reach this address on before October 24. These questions will n be answered individually, but will be print with answers, and circulated to all co petitors who apply for them.

St. John's and Renfield United Free Church Glasgow.

Mr. James Kennedy Hunter, F.R.I.B.A the assessor in the competition for a chur to be erected in Beaconsfield-drive, has mad his awards as follows:—(1) Mr. Jam Taylor Thomson, 212, Bath-street; (2) M T. Harold Hughes, F.R.I.B.A., 185, St. Vi cent-street; and (3) Messrs. Stewart an Paterson, 16, Blythswood-square, Glasgo The building is estimated to cost £25,000.

COMPETITIONS OPEN.

PARISH HALL · SHERNBOURNE
for HIS MAJESTY THE KING

This hall has been built by His Majesty the King to supply a social centre for the villagers in connection with the Club which was provided by His Majesty the late King Edward. The walls of the hall are built of local flint stone with local Carstone quoins and dressings, and the roof is covered with old tiles from pulled-down Collegiate buildings in Cambridge. Mr. Chambers, of Dersingham, did the masonry and roofing, whilst the rest of the work was carried out by estate workmen under Mr. Emmerson.

Approached by a steep bending road between high banks and fences, this little village offers all its charms to the first glance of its visitors — the school, the church, the parsonage, the hall and the club, together with a few cottages and a well-designed name post, group themselves round the tiny village green, in a central part of which, on a hillock, stands a magnificent ash tree. Nearby is the spot on the coast known as the earliest landing-place in Norfolk for invaders, and which is the starting point of that ancient trackway going straight across Norfolk and Suffolk, called "Peddlars' Way."

Parish Hall, Shernbourne. Mr. George J. Skipper, F.R.I.B.A., Architect.

THE ARCHITECTURAL ASSOCIATION

EXCURSION TO PRAGUE, VIENNA AND SALZBURG.

Members of the Architectural Association have recently returned from a most interesting and enjoyable visit to Czecho-Slovakia and Austria. The members were blessed with perfect weather which contributed largely to the success of the excursion, and everywhere met with a most generous and cordial welcome. More than a word of gratitude is due to the large number of Czech and Austrian architects and their wives who gave up a large portion of their time to the entertainment of the party and through whose kind offices many doors were opened and many things of the greatest interest seen which would be missed by the ordinary traveller.

The party left London on the morning of Friday, September 9, and travelling *via* Harwich, Flushing, Leopsic, and Dresden, reached Prague on Saturday afternoon where they were met by representative architects of the city and conducted to their hotel.

Official sights seeing commenced on Sunday morning. A special tramcar had been put at the disposal of the party by the kindness of the municipality, and in it the principal historic buildings were visited. On this journey, besides the architect guides, the members had the advantage of a running commentary in perfect English from the conductor of the tram who at the outbreak of war was a waiter in England and was interned for two years in the Isle of Wight. He then enlisted in the English Army and served till the end of the war as a private in the Buffs! His knowledge of the vernacular was often startling.

Old Prague is one of the most romantic and fascinating towns in Europe, and reflects in its irregular, mediæval plan its stormy history. It lies on both sides of the river Moldau (Vltava), the Old Town on the right bank and the Malá Strana or Little Town on the left, crowned by the magnificent mass of the Hradcany. Access between the two is afforded by the Charles Bridge, dating from the fourteenth century. Two Gothic towers guard the approaches, and upon the buttresses are placed Baroque statuary groups of amazingly contrasted silhouette. Ascending the Hradcany hill the party visited the seventeenth-century Waldstein Palace, notable for a garden loggia, magnificent in scale though poor in detail. A surprise awaited them in the Belvedere. Built in 1536 for Ferdinand I by Paolo della Stella, a pupil of Sansovino, its typical Italian detail appears almost out of place. From the terrace, however, a memorable view is obtained of Prague lying beneath with the great mass of the Hradcany stretching away above. The crowning feature of the hill is the erstwhile Royal Palace and perhaps its most interesting room the Stattnalterei, the scene on May 23, 1618, of the "Defenestration of Prague," when two Imperial councillors were thrown from the window by Count Thurn at the head of the Protestant Estates. The immediate result of this fracas was the Thirty Years War. After a recital of these stirring events lunch was taken, and the party then found their way to the Petrin View Tower on St. Lawrence Hill, where they joined the Sunday afternoon crowd enjoying the view of the town glowing in the strong afternoon sun far beneath.

Next day the members met the State Town-Planning Commissioner at the New Town Hall, where they were shown drawings of the large scheme of town planning that is being prepared for Greater Prague. It is a scheme of first-rate importance that will take many years to complete, and it is being prepared with the utmost care and thoroughness and its inception speaks well for the vigour and enthusiasm of post-war Czecho-Slovakia. Then to the Old Town Hall, where a cordial welcome was given by the Burgomeister, Herr Baxa. The building is largely a reconstruction, but contains the fourteenth-century council chamber, bright with mediæval colour and glittering with heraldic badges and devices. Lunch, and then in motors to visit some modern work, notably a Bank and School of Agriculture by Gocar, and, some distance outside the town, the Social Institute by Kozak. This interesting scheme will accommodate 2,800 poor, including children. It is planned as a series of blocks connected with a common administration building. A striking feature of Czech buildings is the treatment of concrete used either monolithically or in conjunction with brick and stone. Where concrete is exposed it is hammer-dressed with chiselled margins yielding the impression of enormous masses of granite. That evening the members were entertained to dinner by the Prague architects, when our President, Mr. Gilbert Jenkins, was enabled to voice the feelings of the travellers in a felicitous speech of thanks to Dr. Fierlinger, Herren Cenkow, Jezek, Zák, and all who had contributed to the pleasant stay in Prague. Members of the party were left to their own devices on Tuesday morning, and assembled at the station at 4 in the afternoon to take train to Vienna. They received a hearty send off, and left Prague with the knowledge that they were bidding farewell to many new though sincere friends whose work in the future they will watch with much interest.

St. Peter, Salzburg.

No more comfortable or better situated hotel in Vienna than the Krantz could be desired. Equidistant from the Opera, the Hofburg, and the Cathedral, it forms an ideal centre from which to explore in any direction, and when spending days which on an average started at 9 or 10 and ended somewhere the other side of midnight, a central position was found to be a very desirable asset. As in Prague, good-tempered, untiring guides were ready at any moment with information and with a perfect command of English.

On Wednesday morning the party were piloted through the older parts of Vienna and saw in the flesh the many magnificent buildings which, however well one may know their faces from photographs, have to be seen to be fully appreciated. There is an air of dignity attaching to Viennese buildings, both ecclesiastical and secular, which is most imposing, and this effect is augmented by spaciousness of the siting. This applies not only to the work of the seventeenth and eighteenth centuries—the Schwarzenburg Palace or Karlskirche or Fischer von Erlach, or the Belvedere of von Hildebrand, all dating from the beginning of the eighteenth century, are examples which spring to the mind—but also to the great structures of the nineteenth century on or about the Ringstrasse. This great street, which rivals anything that Paris can show, came into being on the removal, in 1857, of the fortifications. Right nobly did the town-planners of that time rise to the occasion; their's was, if not too easy a problem, a stupendous opportunity, and grasping it with both hands, they provided a scheme of almost overpowering grandeur, and, as a consequence, all the important buildings — University, Town Hall, Parliament House, Museums, Theatre, and Opera House—occupy positions consonant with their dignity, adorned by and themselves adorning great open spaces and parks.

Intensive sight-seeing begets hunger, and luncheon in the open air on the outskirts of the park of Schönbrunn formed a pleasant enough interlude before attacking the manifold beauties of the Palace and Gardens. Until the days of the Republic, Schönbrunn was the summer residence of the Emperor, but it is now State property, and is open to the public at all times. The palace was commenced for Emperor Joseph I by Fischer von Erlach in 1696, and the park was laid out in 1753 by Steckhaven and von Hohenburg. The members were extremely fortunate in

Ironwork at Salzburg.

The Gloriette, Schönbrunn, Vienna.

ing for their guide on this occasion Dr. l Holey, President of the Austrian Archi- s' and Engineers' Society and Director of Department for the Preservation of ient Monuments, and with him they tra- sed the State apartments, which were de- ated, and in some cases very splendidly, ing the great days of Maria Theresa. The ty was keenly interested in some of the und-floor garden rooms. These were de- ated in eighteenth-century fresco in a st delightful manner with trees, plants, vers and animals, the colours being azingly brilliant and the general effect onishingly modern. The enormous porce- n stove in one of the rooms had also been igned in the same manner, and instinc- ely brought to mind the Peter Pan ue in Kensington Gardens.

n the evening the members were enter- ied to dinner by the Society, the British nister, Viscount Chilston, being present. ore dining they were officially welcomed the President, and then listened to a most rmative lecture upon the history of nna, given in flawless English by Dr. ter. During the course of his reply to the st, Mr. Jenkins stated that, hearing funds e being collected for the preservation of Castle at Dürnstein, which members were visit later on, and in which all Englishmen k an interest, as it was here that faithful ndel discovered Richard Cœur de Lion, on return to England, he hoped the Asso- ion would be able to raise the balance of sum needed, as a mark of esteem and titude towards their Austrian confrères.

he following two days were given up to inspection of modern building activity. ce the war the Municipality has taken in d, with great vigour, the difficult problem housing. In September, 1923, they passed esolution concerning their housing pro- mme, which was the provision of 25,000 ellings to be built within 5 years. Pre-war sing was poor in quality. Such amenities light and air, water supply and sanitation e little considered, and rents were high. e large blocks of dwellings that have ap- red in pursuance of the Municipality's icy show a complete reversal of this state affairs. On any given site 50 per cent. is unbuilt on and forms garden space. A tral washhouse is usually provided, to ich is attached a bath-house for the use of tenants, and it is no uncommon thing to l very completely furnished and charmingly decorated day nurseries, where small children may be left for a very small charge. The appearance of these big apartment houses is very striking; they are spotlessly clean and evidently well cared for. The gardens are well kept, and an air of decency and order pervades. In general, two types of dwellings are provided. The smaller, comprising 75 per cent. of the whole, consists of hall, kitchen, living-room, bedroom, lavatory, gas-stove, water and electric light. The larger has, in addition, one other room. Funds for their erection have been largely obtained by the introduction of a Housing Tax, and, as Rent Restriction is generally operative, rents are amazingly low; they are apportioned on an area basis, and on an average range from seven Austrian schillings (about 4s. 6d.) per month for the smaller type.

Other buildings visited included a Training School for the woodworking trades, most amply planned and generously equipped, designed by Wilhelm Baumgarten; the Amalienbad, one of the most complete public baths in existence, where for a small sum one can enjoy every form of bathing experience, and a beautifully appointed Welfare Centre by Adolf Stöckl.

On Saturday afternoon the party took tea with Bürgomeister Seitz and Councillors of the State of Vienna at the Town Hall. Sunday was a day of delights, embracing a visit to the well-known Benedictine Abbey at Melk, and the charming village of Dürnstein. At Melk the party were received by the Abbot, and with him they toured this truly magnificent monastery. Built by Brandauer in the early days of the eighteenth century, on a high bluff above the Danube, this example of boisterous Baroque stands as one of the most imposing and startling things to be seen on the whole length of the river, famous as it is for wonderful and romantic sites. Then came a motor drive down the Danube through the Wachau, a land of vineyards and orchards, to Dürnstein, where, at the entrance to the village, members were welcomed by a party of ladies, friends of Dr. Holey, bearing libations and dressed in the beautiful costumes of the district which a resident, Herr Ludwig, has rescued from the limbo of forgotten things. A procession was formed, and the members were conducted through the village to a restaurant, where they lunched in a room gaily decorated with flowers. Following lunch, a humorous little pageant dealing with Richard and Blondel was performed, and the party then inspected the Baroque church and the Prelate's house, now the residence of Herr Ludwig and full of contemporary furniture.

Monday, the last day in Vienna, was spent in unofficial visits, and concluded with a dinner to those who had helped to make the stay such a success, the party enthusiastically assenting when Mr. Yerbury recalled how much they owed to Herren Baumgarten and Willfort, who had organised the programme.

At Salzburg no official visits had been arranged, and members of the party were free to spend the three days as they chose. Salzburg is small in size, but enormous in scale, and bristles with points of interest, its culminating glory being the Castle of Hohen Salzburg, perched on the top of its rock overlooking the town. The Cathedral is disappointing, but the other churches make amends, the Kollegium Kirche of von Erlach showing Baroque at its best. Some of the party were shown the new Festspielhaus, by Holzmeister, and many accepted the invitation of Herr Merz to visit the Elizabeth Duncan School of Dancing and spent an agreeable afternoon. Time was found for excursions to Königs See and Hellbrunn, where one is shown a series of amusing mechanical devices operated by water, and where the gardens, more especially if seen in the late afternoon, are lovely.

[The accompanying illustrations are from photographs by Mr. F. R. Yerbury.]

Reumann Hof.

(Built under the direction of the Municipality of Vienna.)

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Spoiling the Countryside.

Sir,—Having just returned from a delightful holiday in West Sussex and the Selsey peninsula, I am glad to see a short article in *The Builder* on the spoiling of the countryside by regrettable architecture. In many parts of that charming country hideous rows of cottages in scarlet and white are being erected, presumably by some public body, to judge by their uniformity.

Whilst one realises that these cottages are needed, and that it is perhaps necessary from motives of economy to build them in rows, surely some scheme of colour could be chosen which would tone in more with the prevailing tints of the countryside.

I have no technical knowledge of the great craft represented in your paper, but should imagine it is not an insuperable difficulty to make a tile of a grey colour as economically as a scarlet one, and the effect of white cottages would then be rendered pleasing instead of offensive.

I have in mind as an example a delightful house just completed in the village where I stayed, which is a white building covered with grey slates, in close proximity to old coastguard cottages. The whole effect, looked at from anywhere in the neighbourhood and in any light, is pleasing and restful. It is the bright red tiles which do the mischief. P. J. Bailey.

Art and the Signboard.

Sir,—In recent times there has been a wonderful improvement in pictorial signs; but it is a pity that painters do not

trouble to take more than a cursory glance at their subject. Here we have a specimen, with mediæval ironwork good, probably made by a country smith; there are, however, the prevailing faults—the crown out of proportion and lettering bad. A study of the works of Hogarth, Wilson, and George Morland, or any work on armorial bearings and crests, can easily be made. Charles Mattingly.

Cheshire Town-planning.

Hazel Grove and Bramhall Urban Council has agreed to the formation of a town-planning group, including Bredbury, Romiley, Hazel Grove, Bramhall, Marple, Yeardsley-cum-Whaley, and Disley subject to satisfactory representation and financial obligations.

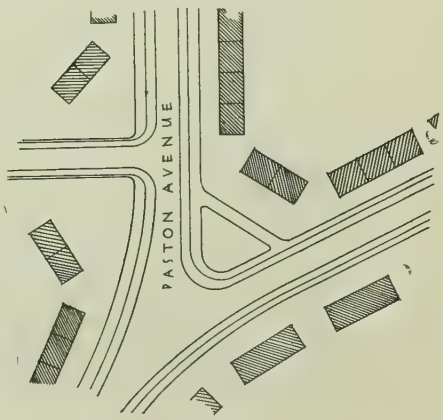
Scottish Legal Life Assurance Society, Glasgow, Competition.



This competition was promoted for the purpose of providing headquarters in Glasgow. The site is an island one, in an excellent position. The conditions provided for a two-stage competition, the first stage being open to all architects. From the designs submitted there were to be selected not more than ten and not less than six to take part in the final stage. To each of the architects taking part in the final stage an honorarium of £200 was to be paid.

The main problem of the competition was (a) to provide a small amount of accommodation for the Society on the ground floor, with a considerable amount of storage accommodation in the basement or sub-basement, and the provision of office accommodation for the Society on the two uppermost floors; and (b) the planning of the remainder of the floor area in a manner suitable for ordinary commercial purposes, such as offices, warehouses and shops.

The design now illustrated, by Messrs. Welch and Hollis, F. and A. R.I.B.A., was one prepared for the final stage of the competition, the winning design, that of Messrs. Wright and Wylie, having been published in our issue for September 2.

City of Norwich Housing Scheme, Drayton Estate.

We illustrate views of some of the houses which are just nearing completion on this estate. Some have walls of concrete blocks and rough-cast, others are in red brickwork; the former cost £436 and the latter £418 per house. These prices include bath, water closet, duplicate drainage, water supply,

City of Norwich Housing Scheme : Drayton Road Estate.

electric light, gas, paths, fences a gates. The contractors engaged on the wo are Messrs. Rice Bros., Messrs. Greengr and Son, Mr. Carter and Mr. Fisher, all Norwich. The architect is Mr. George Skipper, F.R.I.B.A., who is one of a pa of four architects; the others being Mess A. F. Scott and Sons, Mr. S. J. Weari and Mr. Livock. The City Engineer p pared the lay-out.

Bank of Liverpool and Martins, Ltd., Bournemouth.

This new branch has been erected at 1 130, Old Christchurch-road, Bournemou The front, which occupies an importa corner site, is executed in Portland sto with bronze ornament. All the internal f tings are in polished mahogany.

The general contractor was Mr. W. Fussell. The mahogany fittings were Messrs. J. P. White and Sons, Ltd., Bedford, and the strong-room by Mess Lips, Ltd., of London.

Mr. H. R. Collins, F.R.I.B.A., was t architect.

Bush House.

We illustrate this week a perspective vie of the Aldwych frontages of the two ne wings of Bush House, which are to be erecte shortly. We gave an elevational drawing these frontages in our issue for September Messrs. Helmle and Corbett and Harris are the architects.

Wandsworth Town Hall.

The old Town Hall is situated in Hig street, Wandsworth, and in 1920 this ro was widened considerably, the front of t Town Hall removed, the size of the Ha curtailed, and a temporary front erected the new line of road. The Borough Coun owns land adjoining the old building on t east side, and it is upon this land that t new Town Hall has been erected. The o Hall has been remodelled and adapted so th if required it may be used *en suite* with t new Hall by means of connecting lobbie The building is steel-framed, encased in bric work, and the elevations are of brick a stonework, with metal casements to a windows. The new building includes mun cipal offices on the ground floor, and a lar hall to accommodate about 800 persons the first floor. Each hall has a stage a the usual appurtenances. The interior decor tions of the halls include a high oak panell dado, plastered panelled walls and plaster elliptical ceilings. A perspective drawing the exterior of the building was given in o issue for March 7, 1924. The view of t large hall which we publish shows its u as a dancing hall.

Mr. Ernest J. Elford, M.Inst.C.E., t Borough Engineer, is the architect for t work.

Highgate Golf Club House.

This building has been erected on t site of the old club-house, which was cor pletely destroyed by fire in July, 1926. T general arrangement of the new building w somewhat restricted by the necessity fo using the foundations of the old buildi as far as possible, but the rooms are a arranged in such a way as to give a fu view of the course and the magnificent viev from the top of the Highgate hills, whe the club-house is situated.

Messrs. W. H. Woodroffe and Son, of Bedford-row, W.C.1., were the architect The general contractors were Messrs. Joh Willmott and Sons, Ltd., of Hornsey: Messr Young and Co., of Westminster, supplied th steelwork; and Roberts Adlard and Co., Bermondsey, the roofing.

Harrow County Boys' School.

The original building to which these add tions have been made was erected in 191 and the additions have been designed harmonise with the old work. The pla shows the accommodation provided.

Messrs. Maddison, Ltd., of London, carrie out the work at a cost of £9,705. The hea ing was carried out by Messrs. Haden the electrical lighting by Messrs. T. Clarl and Co., Sloane-street, the laboratory f

by the Educational Supply Associa- the wood block flooring by Acme Pav- and Flooring Co., and the reinforced by the Indented Bar and Concrete neering Co.

e architect was Mr. H. G. Crothall, I.B.A., Architect to the Middlesex ty Council, Guildhall, Westminster.

ers' Quarters at Vizagapatam Harbour, India.

ese quarters have been erected at Viza- am for officers who are to reside there in ction with the new Vizagapatam Har- Vizagapatam is at present a small town ted on the east coast of India midway een Calcutta and Madras. A large our scheme is being started, which, finished, will afford much additional rtance to this section of India. These ers are constructed of roughly-dressed stone, with roofs of Mangalore tiles. underlying principle in the designs is to e cross ventilation in all the main rooms. e architect for the work is Mr. Bernard hews, F.R.I.B.A., Calcutta, India.

stwood's Grammar School, Northleach.

is building has been erected in the old wold town of Northleach and will house Grammar School, which was founded e in 1559. As the building is situated t seven miles from a railway station in a hilly district, a light form of con- ction was adopted. The building is ely of steel frame construction, with r walls of 9-in. brickwork covered with rproofed stucco and inner walls of stos sheets on timber framing. The roofs covered with Stamfordstone tiles. The lows which are seen from the road be- to staff rooms, cloakrooms, corridors, The large steel windows which light the rooms all face south and overlook the ng-field. The forecourt is paved with ng stones removed from the disused hleach prison. Cookery room, meals and handicraft room are provided in tached building.

he architect was Mr. R. S. Phillips, I.B.A., of Gloucester. The following con- ors were engaged upon the work :— rs. Espley and Co., Ltd., Evesham, build- Messrs. Woodward and Co., Gloucester, ing; Messrs. Gardiner, Sons and Co., Bristol, steel windows.

MEETINGS

FRIDAY, *October* 21.

verpool Architectural Society. Mr. vey Wiley Corbett on "Why Sky- pers?" Also opening by Mrs. Corbett he New Studio. 5 p.m.

ondon Society. Visit to Walpole's "Gothic le," Strawberry Hill. 3 p.m.

SATURDAY, *October* 22.

corporated Association of Architects and eyors. Opening of the New Institute. , Wilbraham-place, S.W.1. 11 a.m. An- Dinner and Dance. At Hotel Cecil, . 2. 7 p.m.

stitution of Municipal and County Engi- s. Yorkshire District. Doncaster. 11 a.m.

asgow Architectural Craftsmen's Society. t to Chance Bros.' Works. 3 p.m.

ssociation of Architects, Surveyors, and nical Assistants. Visit to Messrs. Gillett ohnston's Works, Croydon. 3 p.m.

stitution of Electrical Engineers (Dundee Centre). Chairman's Address by Mr. H. T. Swire.

MONDAY, *October* 24.

stitution of Electrical Engineers (North- ern Centre). Chairman's Address by Mr. Paterson. At Armstrong College, New- le-upon-Tyne. 7 p.m.

niversity of London. Professor R. Elsey th on "The London Building Acts as cting the Practising Architect." At Lon- University. 6 p.m.

Architectural Association. Presidential Address by Mr. Gilbert H. Jenkins. At 7.30 p.m.

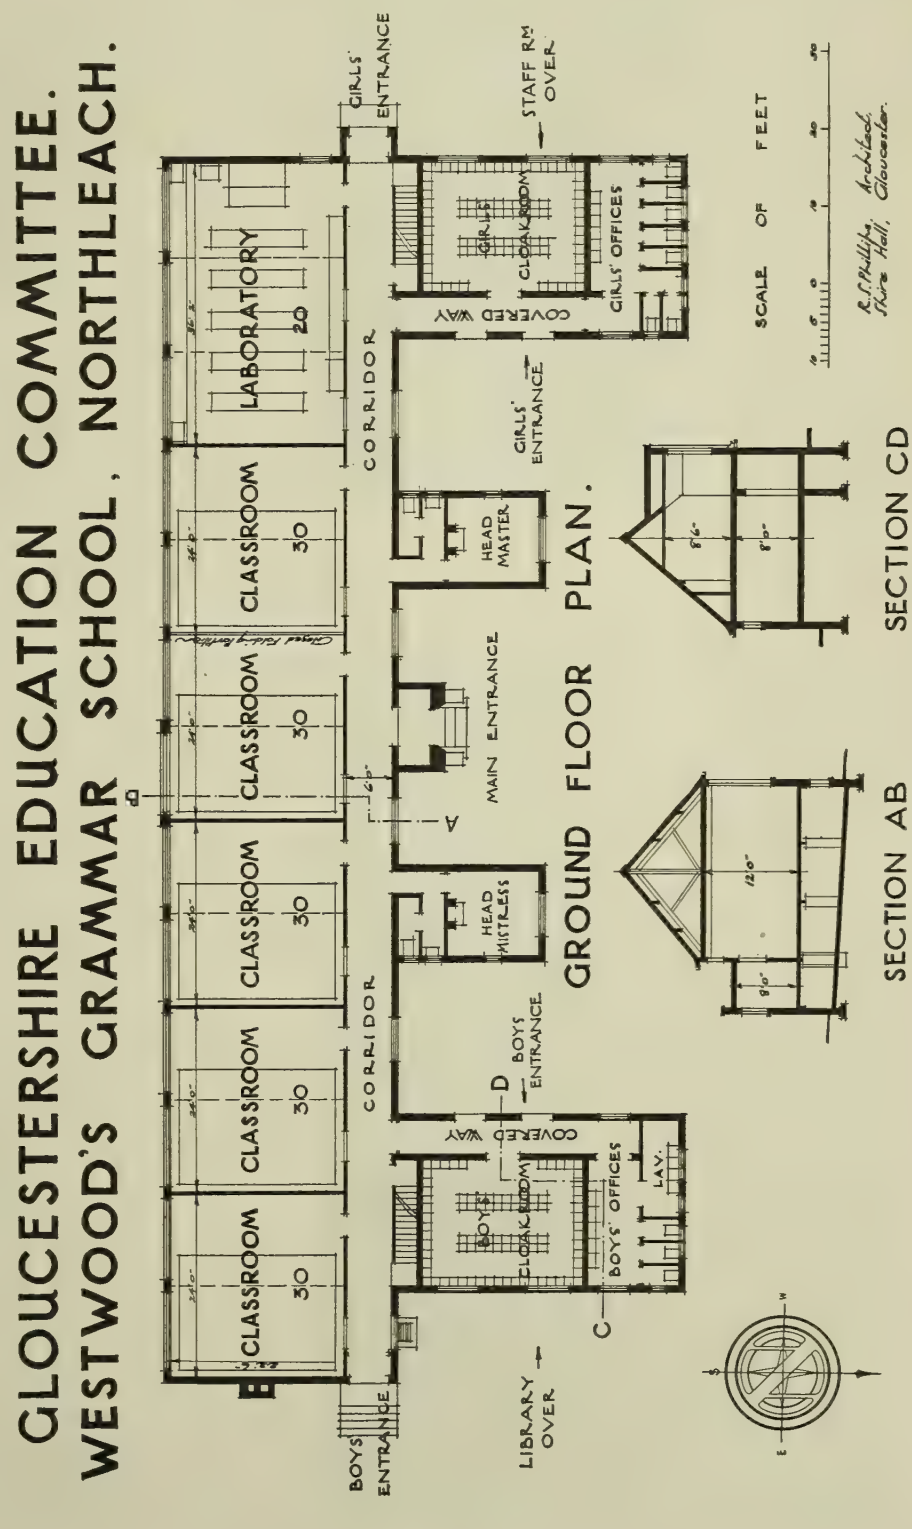
TUESDAY, *October* 25.

Royal Institute of British Architects. Opening of an exhibition of pastel sketches of landscape by Mr. Raffles Davison.

WEDNESDAY, *October* 26.

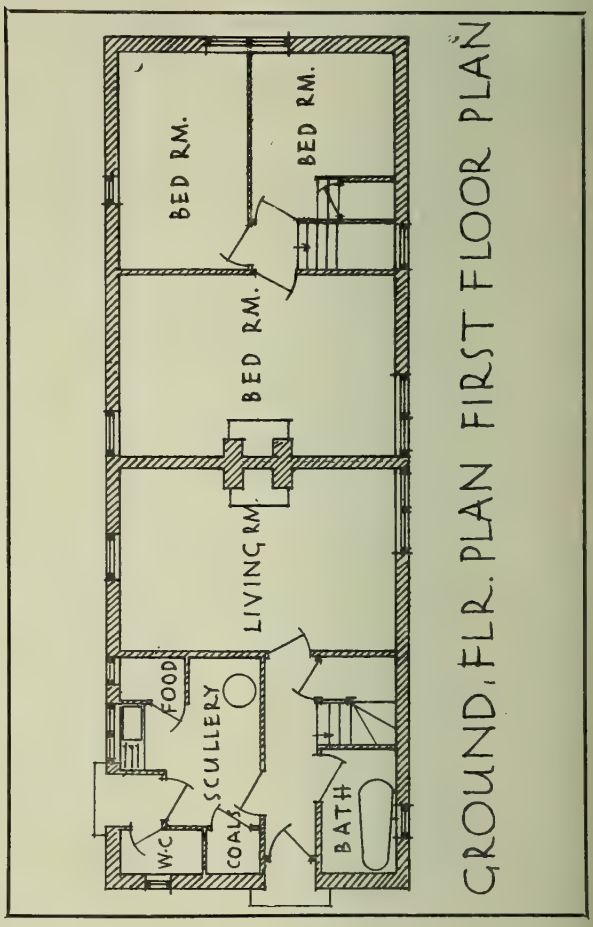
L.C.C. Central School of Arts and Crafts. Sir Banister Fletcher on "Italian Architecture: II." Southampton-row, W.C.1. 6 p.m.

THURSDAY, *October* 27.



Society of Antiquaries. Ordinary Meeting. At 8.30 p.m.

Victoria and Albert Museum. Mr. A. J. B. Wace on "Sheldon Tapestries." At 5.30 p.m.



FRIDAY, *October* 28.

Glasgow Architectural Craftsmen's Society. Mr. T. C. Campbell Mackie on "Education of a Designer." At Royal Technical College. 7.45 p.m.

Royal Sanitary Institute. Discussions on "The Influence of Overcrowding upon Tuberculosis, with special reference to the new Housing Schemes"; "The New Factories Bill"; and "The Smoke Problem on Tyneside: How is it to be Tackled?" At Newcastle-upon-Tyne. 7 p.m

City of Norwich Housing Scheme: Drayton Estate.

Westwood's Grammar School, Northleach, Gloucester.

Mr. R. S. Phillips, F.R.I.B.A., Architect.

HALIFAX EQUITABLE BUILDING SOCIETY AND EQUITABLE BANK, LTD., BOURNEMOUTH.

COMPETITION FOR SCOTTISH LEGAL

Design submitted by Messrs. Herbert

SOCIETY'S NEW BUILDING, GLASGOW.

I.B.A., and H. C. Hollis, A.R.I.B.A.

Front Elevation.

Additions to Harrow County Boys' School, for the Middlesex County Council.

Mr. H. G. Crothall, F.R.I.B.A., County Architect.

Additions to Harrow County Boys' School, for the Middlesex County Council : Back Elevation.

Mr. H. G. Crothall, F.R.I.B.A., County Architect.

SECONDARY SCHOOLS

BY T. P. BENNETT, F.R.I.B.A.

ONSIDERABLE developments have taken e in the last decade in the planning and pment of secondary schools. In some s these developments have been of a lutionary character; in others revision fol- d revision so rapidly that it is difficult for those in close touch with such matters ealise the point finally reached. It is, of se, common knowledge that certain ters are well open to sharp differences of ion, and therefore in giving the following s, where more than one view exists, or re there appears to be no accepted prin- e, information under different headings been given. Although this information ts in published form it is not always ssible, neither is it always possible to d the time required to digest a lengthy tise and make a statement of essentials.

ie principal publications dealing with the er are as follows:—

) The standard work on School Planning, Felix Clay.

) The Building Regulations for Secondary ols, published by the Board of Educa- (1914; Reprinted 1920).

) A paper read before the Liverpool itectural Society on February 17, 1913, Percy Morris, and published in the B.A. *Journal* on August 13, 1913.

) A paper on School Design, read before R.I.B.A. in November, 1921, by Geo. H. lows, and published in the R.I.B.A. *nal* on November 26, 1921.

) Notes on American School Planning "Modern School Houses."

summary of this information gives the ving points:—

til 1872, schools were conducted for the part in places adapted for the purpose or wise built as large rooms in which ren were taught in classes, without any organisation or school planning as such. the development of education came the -teacher system, a system practised st entirely for the purpose of economy which has long since fallen into disuse.

1872, Professor R. Smith designed a al-hall school which has become famous e "Ben Jonson" type. A plan of this l and a discussion on its merits will be in Felix Clay's book, but it was con- ed on account of (*a*) waste of space and aste of staff by the provision of separate ers in separate classrooms. For a con- ble period schools reverted to much less actory types, but subsequently the ad- ges of the central-hall type were recog- and it became general until 1904.

1902 was passed the Education Act, brought into existence medical inspec- f schools, and, as a result of the work . Reid and Dr. Leonard Hill, school ing went through a lengthy series of es, all of them aiming at improved ven- n. At the present moment it may be hat ventilation is the foremost principle ool planning, that a perfectly ventilated is one of the ambitions of school ers, and that it is given preference over every other consideration.

h this end in view the site is selected, hool laid out, and the windows detailed e the maximum amount of sunshine and nd, as a result, single-story buildings, corridors, cross ventilation in the rooms elves, and a completely detached hall garded as highly desirable if not abso- essential elements of every school build- It is obvious that there are many involved in these questions.

Site.

The site should be as open as possible and not adjacent to railways or busy thoroughfares, as, apart from other objections, the noise from either of these sources is a serious drawback to teaching. The school should be conveniently situated for the district it is intended to serve and should have a south aspect. Classroom windows are best when facing south-east, and in the warmer parts of the country east is preferable to south. South-west aspect is found to give too much sun in the afternoon, but not sufficient in the morning. Increase in the amount of motor traffic on the roads suggests the consideration of guards to the exits to prevent children rushing into the street (see Fig. 1). Adequate supervision of the playgrounds from the school building is desirable. The area of playground required per pupil is 50 sq. ft., with a minimum total area of 750 sq. ft. Surface drainage is required, and cinders, grass, gravel, or loose stones should be avoided. Bicycle sheds should be provided. Playing fields in addition to the actual playgrounds are essential, with a minimum of 2 acres per 100 students, and, as a general rule, boys require more than girls.

Entrances.

Entrances must not lead direct into the assembly hall or other room, and must not be used as cloakrooms. Doors must open outwards, and, if the school has accommodation for over 150, more than one exit is required. In schools attended by girls and boys separate entrances are necessary for each sex.

In America, in mixed schools, three entrances are provided, allocated as follows: 1, girls; 2, boys; and 3, public. External and unsheltered steps are avoided as being dangerous in frosty weather, and two sets of doors are provided as a protection against the cold and wind.

Staircases.

There should be separate staircases for girls and boys, or, if more than 150 pupils are accommodated in the school, there must be more than one. Staircases must be fire-resisting, not less than 4 ft. wide, and must have at least one external wall; risers should be 5½ in. to 6 in. high, treads 11 in. to 13 in. wide, and the maximum number in each flight should be 14; winders are not permitted.

In the High School for Girls, Birmingham, one staircase for ascent and one for descent was provided, but this is not usually practicable, and it is questionable whether it is desirable.

American regulations require staircases to be sufficient to empty the school in three minutes, and provide that no classroom shall be more than 40 ft. from a staircase. They are limited to a maximum width of 6 ft. and a minimum of 5 ft. Single flights are avoided, strong preference being given to two flights floor to floor and a single wide landing.

Generally, short flights of steps have a tendency to induce pupils to jump. Hardwood treads on concrete form a more satisfactory finish than most other materials.

Corridors.

Corridors should be from 6 to 8 ft. wide, and well lighted. Corridors for assembly are no longer required. Tiles and wood-blocks have been recommended as the best flooring material, although economy may sometimes demand the use of granolithic. In America main corridors have a minimum width of 8 to 10 ft.

Assembly Halls.

Assembly halls must have an area of 8 sq. ft. per pupil if the number of scholars is 150 or less, and 6 sq. ft. per pupil if over 150. They should not have direct access to classrooms on account of noise, dust, and the need for adequate ventilation. It is desirable to provide a separate gymnasium, but where this is not possible the hall must be suitable for use as a gymnasium by planning it as such with regard to lighting, ventilation, flooring, and wall-space. In small schools where a hall cannot be specially built, movable partitions may be installed in one or more of the classrooms for assembly.

In America 6½ to 7 sq. ft. of floor-space are allowed per pupil, exclusive of the stage. No chair may be more than 11 ft. from the gangway. Lighting must be from both sides and may be supplemented from the top, but it is prohibited from the ends.

The practice is growing of erecting the hall entirely separate from the school buildings but easily accessible therefrom, a notable plan of this kind being that of the Ilkeston Secondary School, Derbyshire, by Mr. George H. Widdows. It is desirable that there should be separate entrances for the stage, for use in the case of dramatic performances, prize-givings, etc.

Classrooms.

At least four classrooms are required for every 100 pupils, each containing not more than 30 and not less than 15 scholars. A lecture-room is usually required in the larger schools, but may be counted as a classroom if suitably arranged. Most modern secondary schools are planned for single desks, the total floor area being not less than 16 sq. ft. per pupil. Long narrow rooms should be avoided. The height must not be less than 12 ft., if the ceiling is flat, or less than 10 ft. to the wall-plate and 13 ft. to the ceiling if ceiled at the collar-beam. Classrooms open to the ridge are not permitted. Subject to the adequacy of the cross-ventilation, the Board of Education has power to sanction slightly less heights than the foregoing. The collective area of glass for lighting purposes

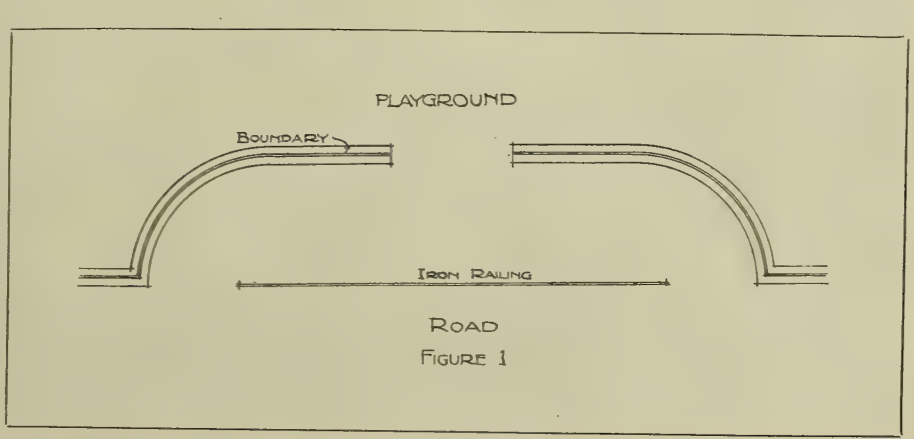

FIGURE 1

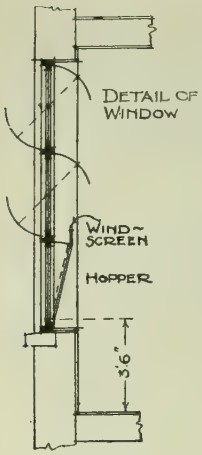

FIGURE 2

must not be less than one-fifth of the floor area. Left-hand lighting is preferable, but if bi-lateral lighting is employed the strongest light should come from the left. Windows facing either the pupils or the teacher are to be avoided. Skylights are not regarded favourably by the Board of Education, but they have been tried in some cases with success.

Unless the top of the window is more than 12 ft. from the floor, desks may not be farther than 20 ft. from such windows. The glass line must not be higher than 3 ft. 6 in. above the floor. French casements may be approved in some cases. The provision of a platform for the teacher is optional but desirable, and if provided should be 6 in. high. Ample wall-space is necessary for maps, diagrams, and blackboards. A sixth form room may be provided with chairs and tables, and under certain conditions may be used as a library and reading room.

Experiments in Germany quoted by Felix Clay give the following results in connection with lettering on blackboards.

1 in. letters on a blackboard: Out of 81 scholars 76 could read them at a distance of 27 ft. 9 in., and 54 could read them at a distance of 46 ft. 3 in.

The conclusion arrived at is that 35 ft. is the maximum length for a classroom. In German schools the breadth may not be less than two-thirds or more than three-fourths of the length. Various other proportions have been quoted by different authorities giving approximately the same results. Information with regard to classrooms in America and Germany is given below:—

Name of School.	No. in Class.	Size of Room.	Sq. ft. per head.
Boston High School	42	3:0″ ×28′0″	21
Professional High School, Pantuchet ..	49	32′0″ ×32′0″	21
Hohere Burgerschule	36	24′1¼″×18′4¼″	15
New Building, Lessings Gymnasium, Berlin	42	29′6¼″×21′4″	13
Sekundarschulhaus, Zurich	42	36′0″ ×22′11½″	20
Madenschulhaus, Zurich	48	37′0″ ×22′11½″	17

Doors to classrooms should be from 3 ft. to 3 ft. 3 in. wide, and at the teacher's end of the room. Colouring to classrooms should be considered carefully, a restful shade of green receiving strong support from the greatest number of authorities, although buffs of various tints give an impression of sunlight and brightness which is very valuable.

So far as artificial lighting is concerned, semi-indirect is best, as point-lights throw strong shadows which at times make work extremely difficult.

In America classrooms provide for from 30 to 50 pupils, having 18 sq. ft. per head, and a minimum volume of 216 c. ft. per scholar. It is stated that 20 sq. ft. and 260 c. ft. respectively would be preferable. It is recommended that doors should be from 40 to 44 in. wide, and at the teacher's end; that the rooms be 13 to 14 ft. high; and that the length be not more than 36 ft. nor the width more than 25 ft.

It may be stated as a matter of experience that advanced individual tuition cannot be given to more than 20 or 25 students by one teacher, but class-teaching, with such individual tuition as is involved in answering questions, etc., is possible with a class of 30.

A space 7 ft. 6 in. deep and the whole width of the room should be reserved for the teacher. Doors partially glazed are desirable. Fireplaces must be avoided and heating arranged by means of a system of low-pressure hot water with pipes and/or radiators. Sliding partitions are not sound-proof, and should be avoided where possible. The method of opening windows is important, a satisfactory detail being that shown in Fig. 2. Other types are, however, frequently employed.

Laboratories.

Steel windows add greatly to the access of unobstructed light.

In schools having 150 pupils or more over twelve years of age there must be at least one laboratory. Two hundred pupils require two laboratories, and 300 require three. A floor area of 30 sq. ft. is necessary per head, and must be considered in conjunction with the actual spacing of benches, fume-cupboards, etc. Benches may be 3 ft. 6 in. by 2 ft. 3 in. for single students, and 3 ft. 6 in. by 4 ft. 3 in. for those working opposite each other. Gangways must be 3 ft. wide where students are working one way and 4 ft. where they are working back to back. The demonstration table and benches must be equipped with gas, water, and sinks, and separate benches may be necessary for special work, but in larger schools these are often placed in small additional rooms. Special provision should also be made for optical and photographic work, with the necessary preparation rooms, darkrooms, and storerooms.

The botanical laboratory must have a sunny aspect for growing plants, and a narrow bench under the windows for physiological experiments. Ordinary plain benches 3 ft. 6 in. by 2 ft. 6 in. per pupil should be provided. Glasshouse accommodation is desirable.

Lecture-rooms are required in schools having more than 250 scholars, and must have raised seats, a large demonstration table, and provision for darkening the room. There must be a total area of 14 sq. ft. per head for the first 30 pupils and 12 sq. ft. per head above that number.

Science and botany laboratories should be grouped as closely as possible. Various arrangements of benches have been adopted, of which the one shown in Fig. 4 appears most suitable. The flooring and drainage of laboratories require special attention. The top floor of a building or any other position where north light is obtainable is a specially suitable place for the science group. Ben are usually constructed of deal or pitch p teak is preferable, but expensive. The st accommodation must be ample.

(To be continued.)

FIGURE 4.

ROYAL INSTITUTE OF INDUSTRIAL ART

Exhibition of Pottery.

The exhibition of pottery now open in the orth Court Annexe of the Victoria and bert Museum includes a wide variety of amples, and is evidence of the improvent in mass production, through the greater straint and fitness to the purpose in what shown. These examples reveal to us a owing refinement of treatment in the nited sense in which emotion can be conyed through mechanical production. On e industrial side, the firms exhibiting potry include Josiah Wedgwood and Sons, d.; Worcester Royal Porcelain Co., Ltd.; seph Brown and Son; A. E. Gray and .; Copeland and Sons; George Jones and ns; W. Moorcroft, Ltd., and the Pilking-n's Tile and Pottery Co., Ltd., and the coeration of these prominent firms is a very reeable evidence of the support and assisnce given by industry to the aims of the itish Institute of Industrial Art.

How difficult it is to reconcile the first-nd quality of craftsmanship with the aracter of mass production is illustrated in e plates shown by Dora M. Billington, nere the design freely painted by hand is posed on plates of apparently ordinary comercial manufacture. The mechanical finish these plates is emphasised in contrast with e former, with evident loss of unity. We ve therefore to bear in mind the obvious sparity between this first-hand freedom of ndling, and the industrial result from nich we must not ask more than it can ve, or deceive ourselves that it can give much. Josiah Wedgwood & Sons, Ltd., ow a coffee and tea service of very ce shape and refinement of colour, amples of the growing improvement in instrial design, and the somewhat mechanical ish is only what is due to the rigidity of e machine over the freedom of hand treatent. A charming series of tiles, designed E. Bawden and Harold Stabler, have just at quality of treatment lacking in the achine, and which is integral in a work of t. Not that the fact of hand treatment is in self the inevitable security for more artistic sults. It is difficult to determine whether, ter all, there has been loss or gain as yet the association of the artist with the anufacturer. The inevitable loss of freem makes his genius droop. In certain ses this is not so, but without distinguishg particular examples, some panels in relief veal the artist as losing instead of gaining applying his art to these objects.

There are among the exhibits of pottery autiful examples of stone and slip ware by ernard Leach, one of the foremost of conmporary potters. The single example own, "Jupiter and the Princess of hœnicia," by S. Nicholson Babb, is a finely odelled group of distinguished character by sculptor who is well known in other direcons of his work. R. F. Wells exhibits me fine bowls of grey and white crackle aze. Miss H. F. Rock's "A Terrible Adenture," a gracious little lady terrified by toad, has charm and delicacy of modelling. hœbe Stabler has several examples of her fted and compelling art. Though slight in xecution, as perhaps fits the purpose, we are alous lest a talent so fine in its approach ould be diverted to lesser ends to meet the mpulsions of a commercial age.

In any case, the ladies have it in this exibition, outnumbering artists of the other ex, and not without some claim to hold the urels into the bargain. Prominent amongst nese exhibitors is the work of Stella M. rofts, whose vividly modelled and coloured nimals in mat or semi-mat glaze are already ell known and appreciated. Mrs. Leeming's owls and jars are good in form and colour rface, and praise were equally due to other xamples did not space forbid.

We have to be grateful to the British Intitute of Industrial Art for bringing this exibition together, which should be visited by ll those who would judge for themselves of the beauty and character of the best modern pottery. For we need the courage to believe in our own work. This sense of our own power to do things, to create an art, and direct industry to the full use of it, is a national concern, and it is therefore gratifying to be able to say that there are examples of pottery shown in this exhibition comparable to the best of any time.

NOTES ON PICTURES

Percy Lancaster's Water-colours.

One of the best collections of modern water-colours which has been seen at the Walker Galleries in Bond-street is that by Mr. Percy Lancaster. In some of his moods the artist gives a well-nigh perfect expression of water-colour art, as in the Bassenthwaite (3) or the "Harvest Field" (16). In the "Bridge on a Moor" (54) the intense calm is wonderfully felt, and the composition and colour are quite delightful. A very different drawing is a "Yorkshire Sheep Farm" (29), but it has a most pleasing freshness and piquancy. The "Shap Abbey" (28), "The Road to the Quarry" (7), and "Twilight on a Moor" (58), are amongst the more noticeable of the sixty drawings exhibited.

Geo. Horton's Water-colours.

Tenderness and subtlety are characteristics of Mr. Geo. Horton's water-colours at the Fine Art Society's, as in the "Rotterdam Coast Scene" (8). He invests simple subjects with charm, as in "Eel Boats, Holland" (49), where a pleasing colour effect and mysterious distance attract one. He is at his best in "Winter, Dorcht" (16) or "The Crosstrees" (20).

Coloured Woodcuts by Bresslern Roth.

The exhibition of coloured woodcuts, drawings and miniatures by Bresslern Roth at the Fine Art Society is well worth seeing The artist has an admirable sense of design and colour, and many of the panels showing the decorative treatment of various animals are very attractive. There is a breadth and vigour of handling in these works which are not mere coarseness and roughness, as is the case of many coloured woodcuts.

Various Modern Artists.

The small collection of modern pictures at Messrs. Colnaghi's galleries includes especially good examples, such as Munnings' "Bull," and Sir J. Holmes' remarkably telling picture, "Whernside." There is also one of the most convincing and pleasing portraits by Glyn Philpot; this is a very able piece of work.

Pastels by Raffles Davison.

During the two weeks following October 25 there will be on view a number of pastel sketches illustrating some of the beauty of the countryside by T. Raffles Davison at the R.I.B.A. Galleries. These will have a topical interest, when so much attention is being called to the subject of countryside beauties, which are so seriously endangered by modern activities.

Greenford Estate; Aerials Built into Houses.

Lady Askwith, accompanied by Lord Askwith, chairman of Messrs. Bulland, Ltd., recently visited and formally opened the New Greenford Hall Housing Estate. The houses, which are of the parlour type, are being built on what was formerly part of the Greenford Hall Estate, the property of Sir George Thurston. Messrs. Bulland, Ltd., have had the work in hand for about a year, and between forty and fifty houses have been erected. Nearly three hundred others are under construction, and it is proposed eventually to have a thousand houses on the estate. Many of the latest contrivances have been introduced as household fittings; one novel feature being the installation of indoor aerials in the roof of each house, by which it is hoped to obviate the unsightliness of the long poles of outdoor aerials.

ARCHITECTURE AND CIVIC FORCES

On Wednesday last, Sir Banister Fletcher, F.S.A., F.R.I.B.A., in a lecture at the Central School for Arts and Crafts, dealt with the Early Mediæval or Romanesque architecture of the hilltop cities and the cities of the plain of Central Italy. He said that the wonderful re-awakening of mediæval civic life in Italy made it possible for little cities like Pisa to undertake grand works of architecture beautiful enough to go down to posterity. Each city, guided by its great families, developed its own resources and strove to outshine neighbouring cities with town-planning schemes and by the erection of palaces and churches. The architecture of Pisa drew, like a magnet, people from all parts of the world and reflected through all the ages the varied enterprise of her citizens in that building art which touches human life at all points and involves questions of land and housing, of town-planning and public work. Then the craftsman had his recognised work and place in the scale of civic life. The world-famed Leaning Tower, the Cathedral, and the richly-adorned Baptistery, constituted one of the best-known examples of collective planning of important buildings in the past. This group held a place in Italian fame like the Acropolis, Athens in Greece and the Roman Forum, and a rising spirit of civic independence, coupled with religious idealism, prompted this trio of splendid monuments, and the bells still rang out from the bell-tower of the Campanile to call the faithful to worship as they had done for centuries. Pisa afforded one of those striking instances in which the art of the conqueror was coloured by the art of the conquered, for the banding in coloured marbles was undoubtedly due to Saracenic influence from Sicily.

SURREY QUANTITY SURVEYORS

An executive committee of the Surveyors' Institution recently met at the Surveyors' Institution, 12, Great George-street, when Mr. W. L. Evershed, F.S.I., presided. Mr. C. E. Pease, F.S.I. (South Nutfield), and Mr. S. J. Durdon, P.A.S.I. (Thornton Heath), were elected additional members of the executive committee.

The hon. secretary announced that two members had offered to read papers during the coming session, viz., Mr. C. G. Dobson on "Roof Measurements and Slating and Tiling," and Mr. S. T. Saunders on "The Origin of Quantity Surveying, with a Brief History of Early Customs." It was resolved that the hearty thanks of the meeting be accorded Mr. Dobson and Mr. Saunders, and the dates for the papers were arranged for the last Monday in January and the last Monday in March.

It was decided to hold a meeting of Surrey Quantity Surveyors on Monday, October 31, at 6 p.m., to discuss the "Standard Method of Measurement," and difficulties in relation thereto. As the subject is of interest to all connected with architecture and building, it was decided to open the meeting to all members of the branch.

Any quantity surveyor members residing or practising in Surrey (including probationers and students) are asked to communicate with the hon. secretary, Mr. Henry A. Mackmin, F.S.I., "Glenlynn," Beulah-road East, Thornton Heath.

American Landscape Architecture.

We have received a copy (June 8, 1927, No. 27) of the Official Register of Harvard University, in which are detailed the activities of the School of Landscape Architecture. The school, which is under the direction of Professor J. Sturgis Pray, was founded in 1900, providing the first instruction in landscape architecture in any American university.

SOCIETIES AND INSTITUTIONS

R.I.B.A.

Exhibition of Designs of Students of Schools of Architecture Recognised for Exemption from the R.I.B.A. Intermediate Examination.

The designs of students of Schools of Architecture recognised for exemption from the R.I.B.A. Intermediate Examination will be exhibited at the Bartlett School of Architecture, University of London, Gower-street, W.C.1, to-day, Friday, from 10 a.m. to 7 p.m. and to-morrow from 10 a.m. to 1 p.m.

The R.I.B.A. Board of Architectural Education Bronze Medal and £5 in books for Recognised Schools is awarded for the best set of drawings submitted. This year the following schools, which are recognised by the R.I.B.A. for the purpose of exemption from its Intermediate Examination, have sent exhibits :—

School of Architecture, Robert Gordon's Colleges, Aberdeen.
Department of Architecture, Edinburgh College of Art.
Glasgow School of Architecture.
School of Architecture, University of Liverpool.
School of Architecture, The Architectural Association.
Bartlett School of Architecture, University of London.
School of Architecture, University of Manchester.
R.W.A. School of Architecture, Royal West of England Academy, Bristol.
Birmingham School of Architecture.
School of Architecture, University of Cambridge.
Department of Architecture, The Technical College, Cardiff.
School of Architecture, Leeds College of Art.
Department of Architecture, Surveying and Building, The Northern Polytechnic.
Department of Architecture, University of Sheffield.
Sir J. J. School of Art, Bombay.

R.I.B.A.: American Building Methods.

In connection with the inquiry into the cost and time involved in the construction of buildings in this country which is being undertaken by a Committee of the Architects', Builders', and Operatives' Joint Consultation Boards, a special lecture on the latest American building methods, illustrated by lantern slides, will be delivered by Mr. Harvey W. Corbett, F.R.I.B.A., at the R.I.B.A., on Monday, October 31, at 8 p.m. All architects, builders, building operatives, and others who are interested in the subject are cordially invited to attend.

LEEDS COLLEGE OF ART.

We have received the prospectus for 1927-28 of the Department of Architecture and Civic Design attached to this College. The Department of Architecture was founded in 1902 as a day school for the training of architects' pupils by the Leeds Education Authority, and under the patronage of the Leeds and West Yorkshire Architectural Society (allied with the Royal Institute of British Architects). In 1904 a full-time staff was appointed and a complete course of training provided. The Department was "recognised" by the Royal Institute of British Architects in 1915, as providing suitable training for students undergoing the Exemption Course from the Intermediate Examination R.I.B.A. In 1921 the Department was reorganised under the present head, and full-time courses of three and five years' duration were established; the three years' course leading to the School Certificate in architecture and exemption from the Intermediate Examination R.I.B.A., and the five years' course to the school diploma in architecture. By means of these courses it is possible for the student, on leaving a secondary or public school with the Matriculation or other similar qualification, to receive a complete professional training in Architecture, and to qualify for the Associateship of the R.I.B.A. without undergoing a prolonged period of pupilage in an Architect's office, as used to be the case. By arrangement with the Leeds and West Yorkshire Architectural Society, a part-time course has been established for the pupils in their offices. This course consists of full-time attendance in school for two years, when a thorough grounding in the elementary subjects related to Architecture is given, and followed by attendance at the office for three subsequent years with attendance at Evening Classes. This course has also been recognised by the R.I.B.A. for exemption from the Intermediate Examination. Mr. Harold H. Holden, A.R.C.A. (London), A.M.C., is Principal, and Mr. Joseph Addison, M.C., A.R.I.B.A., is the Head of the Department of Architecture and Civic Design.

OVERHANGING TREES

A correspondent writes as follows :—

Sir,—Your interesting articles regarding the lopping of branches from trees overhanging from neighbours' property state fairly well-known facts, but a certain point arose recently, and you may consider it of sufficient public interest to allow your writer to answer the following question :—

If branches are cut from a plum tree, the chances are in favour of its early death. If I own the plum tree and my neighbour insists upon lopping it, in spite of the fact that I warn him of the probable result, how do I stand when the tree dies?

Can I claim from him the value of a 15-year-old tree, and, if so, what is its value, and would he have been equally liable if he had not received warning and did not know that a plum tree would bleed to death?

S. W. R.

Our correspondent in the above letter raises an interesting point in connection with trees the branches of which overhang neighbouring property, which, in the absence of express authority, can only be answered by reference to the general principles laid down from actual decisions in the Courts, as explained in our recent articles. In his letter he says the point he mentions has actually arisen, but he does not state whether it has been submitted to any tribunal.

If the nature of the tree is such that lopping may prove fatal to it, it does not appear that that fact can justify an owner in planting such trees in close proximity to his neighbour's boundary and then deprive that neighbour of his right to lop branches which overhang the boundary. The tree, whatever may be its nature, planted in such a position, must be subject to the general principles of law applicable in such cases.

We may notice that in connection with Lemmon *v.* Webb (1895, A.C. 1) it has been considered that it was there laid down that there was a right to lop branches of overhanging trees irrespective of the fact whether any nuisance was caused by those branches; thus in Hunt's "Boundaries and Fences" it is stated on the authority of that case "and it would appear that it is not necessary for him" (the neighbouring land owner) "to show that the overhanging branches have caused damage." We think there is some reason to doubt whether this latter statement does not go too far, as the House of Lords based their decision on the principles governing nuisances, and in Pickering *v.* Rudd (1 Stark 56), a case cited in Lemmon *v.* Webb, it is to be observed that it was admitted that the branches caused mischief and found that in abating that mischief no damage to the tree had b done which could have been avoided.

We can only suggest in the absence express authority upon the point that in case our correspondent refers to where trees are of such a nature that they ca be lopped without serious injury to th and the neighbouring owner has been affe with knowledge of that fact, that to jus his lopping them he might be held to b to prove some tangible nuisance to his perty, and in the absence of such proo held liable in damages. On the other h the point we commenced with has to borne in mind—that any tribunal would consider that in planting trees of this na near his boundary the owner could not on the nature of the tree to enable hi infringe his neighbour's rights, and that planting them in such a position he must held to have taken all risks. The amoun any damages would be assessed, of course, the Court or a jury, and we can give estimate of what that would be. The ef on the property of the loss of such trees 15 years' standing would no doubt be ta into consideration in assessing the dama Of course, in any lopping no unnecess damage must be done.

Another correspondent writes :—"I now dealing with a case where a big po tree in the garden of 'A,' close to boundary, has, by the growth of the r and probably also the swaying of the during high winds, caused the collapse the boundary wall, 8 ft. high, between premises of 'A' and 'B,' the wall be 'B's' property. I should be glad if writer of the articles could refer me to recently decided cases of a similar nature to have his opinion as to whether 'B' co successfully sue 'A' for the damage to wall."

[The tree being a large poplar tree apparently been in the same position many years and obvious to both parties, there is no information as to when and whom the wall was erected, nor any sc (plan not reproduced) showing the dista of the tree from the wall. Two possi causes by which the damage was occasio are given :—(1) the growth of the roots, a (2) the swaying of the tree by high win

As regards (1) it appears to fall under principle laid down in Noble *v.* Harri (1926, 2 K.B. 332), as explained in the fi article on Boundaries, Fences and Trees. grow a tree is one of the natural uses of soil and a tree is not in itself a danger object, and where a person is using his la in the ordinary way and damage happens the adjoining property without any neglige or default on the part of the person so us his property no liability attaches to hi Therefore it appears that as regards the ro probably no action would lie.

In connection with (2) the swaying of tree in high winds, different considerati arise. If the damage was done in an exc tional gale that would not afford evidence negligence (Bruce *v.* Caulfield (*The Build* March 15, 1918), cited in the above artic but if the damage occurred in ordinary h winds, then, as was indicated by the Court Appeal, in that case there might be evide of negligence, the negligence there sugges being failure to discover the unsound con tion of the tree. Applying that case to case put by our correspondent, it suggests t if the tree in every high wind was obviou swaying against the wall or might injure wall, this might lead a Court to hold t some precaution, either by shoring up, st ing, or otherwise, should have been tak and the case would fall under the third he ing of the summary of the cases given by Justice Rowlatt in Noble *v.* Harrison : 'person is liable for a nuisance constituted the state of his property if when it has ari without his own act or default he omits remedy it within a reasonable time after has become aware of it, or ought to h become aware of it."]

THE LONDON BUILDING ACTS AND THEIR APPLICATION—XXXI

By H. V. MILNES EMERSON, A.R.I.B.A.

BY-LAWS—(*continued*).

Under the London Council (General wers) Act, 1890, a by-law was made relat- to the description and quality of the sub- nces of which plastering is to be made, efly as follows:—

Laths to be sound, free from sap, or wire tting or other suitable material to the satis- tion of the District Surveyor.

Lime to be freshly burned.

Sand to be clean and sharp, free from m or earthy matter, or ground brick or rnace slag can be used subject to approval the District Surveyor.

Hair to be good and sound, free from ease or dirt or fibrous material to the tisfaction of the District Surveyor can be ed.

Water to be clear.

Portland cement must weigh not less than lbs. to the imperial bushel.

Plastering or coarse stuff to be composed one of lime to three of sand and 1 lb. of ir to every 3 cubic feet of coarse stuff.

Portland, Keene's, Parian, Martin's Seleni- or other approved cement or plaster of ris may be used for plastering.

Setting coat to be composed of lime or ment mixed with clean washed sand, or cement only.

Fibrous slab or other slab plastering of fficient thickness and securely fixed, may used on ceilings, partitions, and walls to e satisfaction of the District Surveyor.

It will be observed that the foregoing ex- act of the by-law embodies the usual speci- ation of materials and proportions used in astering. There are, however, cases in hich this by-law is improperly observed, ore especially in building operations ithout an architect, resulting in falling ilings within a short period after the mpletion of the building. One case curred where ceilings fell after the pur- ase of the house from a builder. For- nately, the owner obtained a warranty d was thus able to recover, but in the sence of such warranty, who would have en responsible for the reinstatement? he District Surveyor under whose super- sion the plastering is done, and who is pecially enjoined under the Duties of Dis- ict Surveyors "to see that the plastering of the description and quality prescribed the foregoing by-law," the builder who iled to carry out the by-law, or the owner ho bought the house, according to law, ith his eyes open?

The last by-law under the jurisdiction of e District Surveyor relates to any excava- on made at a less distance than 3 ft. from e outside of a building, etc., shall be led in with brick or dry rubbish, natural il, etc., to the satisfaction of the District rveyor.

Plans and sections of sufficient detail to ow the construction must be deposited ith the District Surveyor of any intended ection, re-erection, alteration of or addition a public building.

Plan and sections of the intended erection alteration of, or addition to, any house, ilding, or other erection other than a pub- building, must be produced for his inspec- on upon notice from him in writing, but ch plans and sections need not be deposited ith him.

The fees payable to the District Surveyor nder these by-laws will be found under the ction dealing with fees payable to District rveyors.

A by-law can only be valid if it is reasonable nd just, or is supported by a statute under hich it is made. Thus, if a local council ished to acquire private property without mpensation, such a by-law to that effect ould not be *ultra vires* if the statute under hich it was made supported that intention. Also, a by-law which is divisible might be invalid in part owing to that part being unreasonable, and valid for the remaining part or parts; but a by-law which has been made *ultra vires* cannot be made valid by the authority whose consent or confirmation is essential to the validity of the by-laws.

Part XV.
Legal Proceedings.

Section 166.—All offences, penalties, costs and expenses under this Act, or any by-law made under this Act directed to be prosecuted or recovered in a summary manner, or the prosecution or recovery of which is not otherwise provided for, may be prosecuted and recovered in manner directed by the Summary Jurisdiction Acts.

"Summary Jurisdiction Acts." The Acts are the Summary Jurisdiction Act, 1848 (11 and 12 Vict., cap. 43); 1879 (42 and 43 Vict., cap. 40); 1884 (47 and 48 Vict., cap 43); and 1899 (62 and 63 Vict., cap. 22); and any Act, past or future, amending those Acts, or either of them.

Except under those sections where the time is given within which an action can be taken, the limit of time under which proceedings may be taken is governed by section 11 of the Summary Jurisdiction Act, 1848, commonly known as Jervis's Act. The section is as follows:—That in all cases where no time is already or shall hereafter be specially limited for making any such complaint, or laying any such information in the Act or Acts of Parliament relating to each particular case, such complaint shall be made and such information shall be laid within six calendar months from the time when the matter of such complaint or information respectively arose. Where the present Act imposes a penalty for the doing of a thing and does not make that penalty a continuing one for the offence committed, then summary proceedings in respect of such thing or act will be barred after the expiration of six months from its being done or committed.

New Boathouse for Cheltenham College.

Mr. H. Reeves, an old Cheltonian, has presented to Cheltenham College a site for a boat-house, overlooking the Severn, near Tewkesbury, where a house costing £4,500 is to be built. Mr. Reeves recently presented the college with playing-fields.

Building Trade Unions.

Three years ago the Amalgamated Union of Building Trade Workers—the organisation of the bricklayers and stonemasons—seceded from the National Federation of Building Trade Operatives. The bricklayers were not satisfied with the policy of the Federation, which was largely controlled by the votes of the unions of unskilled men. In particular they insisted on forcing the issue of payment for time lost through stress of weather or other causes for which the workpeople were not responsible. Though it was not openly avowed, the bricklayers also believed they would be able to do better for themselves financially if, as craftsmen for whom the demand exceeded the supply, they were free to follow an independent policy. The causes of dissatisfaction that were acute three years ago have disappeared. Independence has not produced all the results that were anticipated, and the question of payment for "wet-time" is still unsettled. A ballot on a proposal to rejoin the Federation was taken recently, and it was announced recently that the re-affiliation had been approved by a large majority. A corollary of the ballot is that the bricklayers' union will again take its place in the National Joint Industrial Council for the building industry.—*The Times.*

BOOK REVIEWS

Electrical Contracting. By H. Ayres Purdie. Pp. xxxii + 371; 186 figs. (London: Ernest Benn, Ltd., 1926.) Price 10s. 6d. net.

This volume is described as a handbook for those engaged in business as electrical contractors. Extensive as is this class of business, it has been singularly lacking in literature until recently, though innumerable books have been published on electrical wiring—for students and manual workers. This book is divided into six parts: Organisation, Administration, Illumination and Installation Work, Electric Heating and Ventilation, Power, and Miscellaneous. The subject is treated from the commercial point of view, though technical matters are adequately dealt with where necessary—indeed, it is rather difficult to draw a line between them in some sections, such as that relating to illumination. This is a branch of his work in which the average contractor has not always attained to a satisfactory degree of efficiency; a walk of 100 yds. in any London shopping area at night will provide only too many literally glaring examples of this fact. Where a consulting engineer is not employed, it falls to the contractor to propose a suitable scheme of illumination, which, whilst being adequate and effective, shall not be so costly as to put his tender out of the running; consequently he ought to be well versed in the scientific principles of illumination, as well as in the most economical methods of carrying them into effect, and he should be able to educate the customer, who usually possesses the very crudest ideas on the subject. We are glad to see, therefore, that the author goes thoroughly into this matter, and provides a mass of practical information and tabulated data, together with examples of "the wrong fitting with the wrong lamp situated in the wrong position" that we so often come across.

Advice is given to the contractor setting up in business, with examples of orders, time-sheets, cash-books, &c. This is followed by sections on advertising and showrooms, estimating for jobs, costing, &c. The execution of the work occupies a great deal of space and covers a wide range, the well-illustrated directions being very practical and revealing a wealth of experience. Finally, domestic uses of electricity are discussed, rather briefly, and the book concludes with a general survey of the whole business, including short contributions by some well-known specialists. Altogether it is a first-class book, which should be in the hands of every electrical contractor.

Site Planning in Practice at Welwyn Garden City. By Louis de Soissons, F.R.I.B.A., S.A.D.G., and Arthur William Kenyon, F.R.I.B.A. With Introduction by C. B. Purdom. (Ernest Benn, Ltd.) 102 plates. 4to, cloth. 32s. 6d. net.

In looking through the one hundred and two full pages photographic plates in this volume, showing existing houses and key-plans (with explanatory texts appended to each), we can see that economical site-planning is the dominant note in the evolution of this rural city. Apparently every advantage has been taken of the original contours of the land, and this has been part of the real economy. Scarcely an original tree has been sacrificed. Even the roadside pond, the grassy verges and the steep roadside banks have been preserved. Houses have been "set back" in order to preserve existing trees, in groups or as single specimens, as focal points. Contrary to the more usual method in planning with secondary cross-roads linking up the main arteries, a system of "close" or "cul de-sac" planning has been adopted. These quiet backwater retreats consist of a number of houses of from five to twenty or more. The book deals only with a part of the settlement; if "the whole is greater than the part," judging by the part illustrated, Welwyn—if it still proceeds on the same lines—must be counted amongst desirable dwelling spots. It may be hoped that the "agricultural belts," as shown on the general plan, may never be de-ruralised.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—Ed.

Cleaning Aberdeen Granite.

[Reply to "Granite," October 7.]

Sir,—Your correspondent may take it that any stains which will not move with soap and water and good elbow grease will be further into the granite than the polished surface. That is to say, if he wants to get rid of them he must be prepared to re-polish the granite. But is it necessary to have things so very clean looking?

Tone.

Sound-resisting Walls.

Sir,—Are there any statistics or records as to the relative sound-resisting properties of 4½-in. brick walls and 3-in. or 4-in. breeze concrete block walls?

Privacy.

Road Construction.

[Reply to "Drysite," October 7.]

Sir,—In further reply to "Drysite," on the facts stated, it would appear that the frontagers should object to what is being done on the grounds that it is unreasonable, and that the expenses that they will ultimately have to bear when the street is "taken over" will be excessive. It is not made clear whether any notice has been served on the owners to "make up" the street under section 150 of the Public Health Act, 1875, or whether proceedings are being taken under the Private Street Works Act, 1892. In both cases provision is made for the making and determining of objections, and "Drysite" should take legal advice thereon. If no "taking over" is immediately contemplated, he should bring his objection to the local authority as above indicated, supporting it with evidence of the unreasonableness of the work being carried out.

In general, the local authority would be entitled to lay the curb so as to suit the falls and natural drainage of the road and the immediate area, but to raise the road as stated would certainly appear to be excessive, and to which objection could be made; and, if insisted upon by the local authority, count as an improvement, the extra cost of which the latter should bear under the Public Health Act, 1925.

The matter should be properly presented.

Law.

Setting up a Centrolinead.

Sir,—Would one of your correspondents be good enough to inform me through the medium of your columns the quickest and most practical way of setting up a centrolinead?

X.Y.Z.

Cost of Houses per Cubic Foot.

Sir,—I should be glad if you would inform me what you consider the present price per cubic foot for dwelling-houses:—(1) Detached; (2) Semi-detached; and (3) in terrace of first, second, and third grades respectively.

V. L. B.

[Detached dwelling-houses of simple construction and inexpensive fittings should be built from 1s. 2d. to 1s. 4d. per foot cube; the semi-detached houses from 1s. 1½d. to 1s. 3d. per foot cube. We do not quite know what our correspondent means by "in terrace of first, second, and third grades," but high-class houses with good fittings and fixtures are costing from 2s. to 2s. 3d. per foot cube. —Ed.]

Cleaning Old Bricks.

Sir,—Can any of your readers tell me what is a fair price for cleaning and stacking old bricks? We are generally told by contractors that it costs as much to clean and stack old bricks as to buy old, but this can hardly be the case, particularly as compared with good facings.

Restoration.

Gauging Mortar.

Sir,—Is there any chemical action that can take place to the ultimate detriment of the mortar, when lime mortar is gauged with a little cement? Are there any records as to the relative strength of lime mortar set, say, six months, and the same gauged with cement?

Strength.

Loamy Sand.

Sir,—In a certain district where the sand is very fine and with little "bite about it," a bricklayer who was working under me asked me to let him add a little clay to the mortar, to make it work "fatter." "Garden cement," he called it. Is there anything to be said against this practice? We are taught to specify sand to be free from loam, and it is somewhat of a shock to be told that this is often not observed and that no bad effects result.

Youth.

Brick Fireplaces.

Sir,—Is there any danger of ordinary firebricks "flying" under the heat, when used as the interior of a brick fireplace? The appearance of this type of fireplace is much happier if one type of brick is used, and I have seen them built for bedroom fireplaces where a fire is not often used, but have not yet seen one after it has been under fire for some time.

Ancient.

Cellar Drainer.

Sir,—Is there any mechanical device on the market for raising the waste water from the sink in a basement kitchen which is 7 ft. below ground level? We cannot get it into the drains, as they are only 3 ft. deep. There is a sewer running by the front and back of the house, but neither is deep enough—the house is 50 ft. back from each road. There is electricity in the house, if it would be of use for working the scheme.

H. S.

The Kingston By-pass Road.

After being in course of construction for the unexpectedly protracted period of four years, Surrey's new concrete highway, officially designated the Kingston by-pass road, is to be formally opened on Friday, the 28th inst., at 3 p.m. The ceremony, which will take place at the junction of the Merton connection with the new road, will be performed by the Prime Minister (Mr. Stanley Baldwin), who will be accompanied by the Minister of Transport (Col. Ashley).

HOUSE BUILDING IN KENYA COLONY

The accompanying illustration shows t type of house that has been built in Ken Colony under the direction of Mr. H. Weller, who was formerly Director of t Building Research Station, and is n Director of Technical Education in Ken He has started a new style of building to s the Colony, consisting of wood and concre Each of these little houses, containing t rooms 10 ft. by 10 ft., will house an Afric teacher who is under training as a supervisi teacher.

In Kenya it is not always possible to obta a hard stone. One house, however, ma with stone laid without mud or mortar, w built recently by a missionary at a cost 200 shillings. Small, thin stones are ha mered in light wedges among the big ston making a solid house which does not sett when it rains. The size of the house is 20 by 16 ft. outside, with walls 2 ft. thick. took five men and two boys 14 days to bui the house, and an ox-cart 12 days for cartin It is pointed in mud and has a grass roo while the doors and windows are unglazed.

Other houses are now being made und Mr. Weller's direction, composed of cl burnt into lime. The walls are made wi wooden posts at intervals of 3 and 4 ft., fill with lime and concrete, reinforced by wi netting. For the framework of the roof the is nothing better and cheaper than wood Kenya, and the most economical roof has bee found to be that made of corrugated ga vanised iron. In the highlands of East Afri such a roof will last for 25 or 30 years. Mo Africans and many Europeans generally buil with a thatched roof. It is found that lon reed-like grasses will last for 12 to 15 year while another excellent thatching material banana bark. The dried leaves are strippe off the stems of the palm, softened in wate and bent double over wooden battens.

Proposed Church at Ollerton, Notts.

Designs have been prepared for a ne church at Ollerton, Nottinghamshire, to b built on a site given by Lord Savile. Th plan is cruciform with a massive centra tower, and is so arranged that it will b in full view when the building is approache by the main avenue. The foundations hav called for much careful thought, for abou six feet of coal will have to be taken fro the site. It is intended to rely upon a sys tem of reinforced concrete foundations, sup plemented with reinforced concrete beams an brickwork. The first section of the churc will cost about £13,000, and it is hoped t commence building at Easter next year. Th architects are Messrs. Naylor, Sale and Moore of Nottingham.

House Construction in Kenya Colony.

THE BUILDING TRADE

)INTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—II.

NOTICES TO QUIT—(*Continued*).

r the close of our last article we showed in the case of both weekly and monthly ncies the notice to determine them must week's notice and a month's notice re-tively, terminating at the end of the odic term.

What is a Week's Notice?

uestions, however, have arisen as to what week's notice. Is it seven clear days or ılendar week? This point has been de-d in Newman *v.* Slade (1926, 2 K.B. 328, *Builder*, June 25, 1926). In that case premises were let on a weekly tenancy mencing on a Monday. On Monday, ruary 8, 1926, the plaintiff gave the tenant ce to quit on Monday, February 15, but vas contended that this notice was bad, it should have given seven clear days Divisional Court held, following a dictum Sidebotham *v.* Holland (1895, C.A. 1 . 378), that the rule is not to count day on which the notice is given to count the day for which it is n, that is to say, a notice given on ıday, if the tenancy commenced on that for the following Monday is good. From judgments delivered in this case, however, ppears that if there is an agreement be-en the parties that the tenancy is to ex-at a particular time, as, for instance, re noon, this contingency must be pro-d for as the notice must allow seven days Weston *v.* Fidler, 88 L.T. 769). The rt, in deciding this case, observed that question in relation to weekly tenancies ıt not to be complicated by reference to ly, quarterly, or monthly tenancies.

What is a Month's Notice?

hen a month's notice has to be given, is a lunar month and not a calendar th. This was recently decided in P. ops & Co. *v.* Rogers (1925, 1 K.B. 14, *Builder*, April 10, 1925), a case we shall to refer to in detail when we consider ces bad for uncertainty. The Court of eal unanimously held in that case that in absence of expressions indicating a con-y intention the common law rule is that ontracts of tenancy the word "month" ns a lunar month, although Lord Justice in pointed out that there are so many ptions to the rule that it was a question the legislature whether the *prima facie* struction of calendar month enacted in the rpretation Act, 1889, ought not univer-y to be adopted.

Savory *v.* Bayley (36 T.L.R. 619) the ncy was for four weeks certain, and if then determined, to continue subject to weeks' notice, and it was held that the ce must be such as to bring the tenancy n end on a day which corresponded to on which it commenced.

Quarterly Tenancies.

the absence of express provision in the ement the notice to determine a quarterly ncy must be a quarter's notice (Towne *v.* pbell, 1847, 3 C.B. 921). If the tenancy n on one of the quarter days the rule we referred to above in connection with kly and monthly tenancies as laid down idebotham *v.* Holland (1895, 1 Q.B. 378) applied in Newman *v.* Slade (*ubi sup*) ld appear to apply, and a notice given on uarter day to expire on the following rter day would be good. It may, however, sked: if the tenancy commenced at some not corresponding to a quarter day, then how many days must the quarter's notice comprise? This question was referred to in Sidebotham *v.* Holland in connection with a yearly tenancy; the tenancy in that case began on May 19, 1890, the rent to be paid by equal quarterly payments on the usual quarter days, an apportioned part up to the first quarter day to be paid on signing the agreement. On November 17, 1893, a notice to quit was given and received on the same day requiring possession on May 19, 1894, and it was contended that this notice was bad as it should have been given for May 18 as on May 19 a new quarter had commenced. It was held by the Court of Appeal that although had notice been given for the 18th that would have been good, it did not follow that a notice for the 19th was bad, as no decision could be found that a notice to quit on the anniversary of the day on which the tenancy had commenced was bad. It was contended in that case that there was a distinction where the tenancy commenced on one of the usual quarter days as by custom for the six months' notice there would then be 183 days, but otherwise the notice must consist of only 182 days, but it was held by the Court that a notice for the anniversary of the term was good. That appears, therefore, the safe rule to follow, taking the day of the month on which the tenancy began, but we know of no direct decision on this point in connection with quarterly tenancies, and the Text Books state that there is some doubt about the length of notice required to determine tenancies for shorter terms than from year to year. In practice, no doubt, it would be usual in a quarterly tenancy to state in the agreement how the tenancy is to be determined, as, for instance, by a month's notice, in which event the decision in P. Phipps & Co. *v.* Rogers shows that the notice would be a lunar month.

Notices Bad for Uncertainty.

It may be convenient here to say a word or two upon the form of notice. It was laid down in P. Phipps *v.* Rogers (*ubi sup*) on the authority of Gardner *v.* Ingram (1889, 61 L.T. 729) that although no particular form need be followed, there must be plain unambiguous words used, claiming to determine the existing tenancy at a certain time.

In Queen's Club Gardens Estates *v.* Bignell (1924, 1 K.B. 117, *The Builder*, June 20, 1924) Mr. Justice Lush expressed great doubt whether the notice was not bad for uncertainty because it contained after the day named the words "on or before which date" possession will be required.

In P. Phipps & Co. *v.* Rogers, licensed premises were let on a tenancy from year to year by an agreement dated May 29, 1908, under which either party could determine the tenancy "upon giving to the other three months' previous notice in writing of his or their intention of doing so, expiring on any one of the days appointed as special transfer sessions by the justices for the district. . . ."

On October 12, 1923, the plaintiffs, the landlords, gave the defendants notice to quit in the following terms: "We do hereby give you notice to quit and deliver up to us or such other person as we may appoint on the earliest day your tenancy can legally be terminated by valid notice to quit given to you by us at the date of service hereof the possession of" (here followed a description of the premises).

At the annual general meeting of the Justices on February 7, 1923, January 8, 1924, had been fixed as one of the special transfer sessions, and by the landlords it was contended that this was a good notice for that session day. That question depended upon whether lunar or calendar months were intended, and as we have shown above, the Court of Appeal unanimously held that in tenancy agreements, in the absence of expressions to the contrary, lunar months are indicated, and therefore, as regards length of time, the notice was good; but there was the further question whether this notice was bad for uncertainty, and the majority of the Court held that it was.

The Court drew attention to the principle adopted in the cases, that the notice must be clear and unambiguous, but that this is not confined to the terms in which it is expressed, but has to be interpreted by the application of the maxim *Id certum est quod certum reddi potest*, which we think may be interpreted as meaning in this connection that the notice must be framed in such a manner that a person possessed with knowledge of all the facts will be left in no doubt as to its meaning. That is a point to be decided upon the facts of each case.

The notice in this case, as Lord Justice Atkin pointed out, left three points to be determined by the tenant, on all or some of which he might have to take legal advice. He would first have to determine the point decided in this case, whether lunar or calendar months were intended; then he would have to decide whether the annual licensing meeting could be a special transfer session, a point on which the plaintiffs themselves had acted under a misapprehension, as they had intended the notice to operate at the general licensing meeting to be held on February 7, 1924; and, lastly, he would have to find out when the transfer session would be held.

Lord Justice Bankes put the case thus: "When, as here, the landlord is not content with placing the tenant under the necessity of solving one difficult question of law before he can know the date when he is required to give up possession, but puts him in the position of having to decide not only the earliest day when the tenancy can legally be determined, but also whether the notice to quit is a valid one, the time has come when, in my opinion, the Courts must say that such a notice is certainly not clear and unambiguous in its expressed terms, and that it requires a degree of knowledge on the part of the tenant which the Court will not impute to him."

There have been judicial decisions and expressions of opinion on what will constitute a valid notice, and it may be useful to conclude this article by referring to them.

In Hirst *v.* Horn (1840, 6 M. & W. 393), in the case of a yearly tenancy a notice to quit for a fixed day "or at the expiration of the year of your tenancy, which shall expire next after the end of one half year from the date of this notice," was held good, and not disapproved by the Court of Appeal in Phipps *v.* Rogers. But the most extreme case, May *v.* Borup (1915, 1 K.B. 830), where in a yearly tenancy notice was given to "quit at the earliest possible moment," was disapproved, although in that case the agreement made the date more ascertainable, as it provided that the tenancy might be determined by six months' notice on either side, to be given on March 1 or September 1 in any year.

In Sidebotham *v.* Holland (1895, 1 Q.B. 378), a case we have previously referred to in connection with a yearly tenancy, Lord Justice A. L. Smith said: "I would point out that the plaintiff has only himself to blame for the difficulties he is in in this case. Had he added the words which are very ordinarily inserted in a notice to quit, 'Or at the expiration of the year of your tenancy, which shall expire next after the end of one half year from the service of this notice,' all would

have been in order," thus, as will be seen, approving Hirst *v.* Horn (*ubi sup.*).

In Queen's Club Gardens Estate *v.* Bignell (*ubi sup.*), Mr. Justice Lush said: "If the party who gives notice is doubtful as to the day on which the notice expires, he can make sure that the notice is valid by adding the words that are given in the common form of notice to quit, to the effect that if the date mentioned is not the real date on which the period expires, then the notice to quit is to expire on the proper day of expiry next after the expiration of the current period. In the light of the decision in P. Phipps & Co. *v.* Rogers, we think this must be said to apply only where a date is given, and not, as in that case, where reference is made to the happening of an event as to which doubt may exist.

DISUSED BURIAL GROUNDS & "BUILDINGS"

A case recently heard by the Chancellor of the Diocese of London in the Consistory Court raised a question of interest. The matter arose in connection with a petition by the Rector and Churchwardens of the united benefices of St. Edmund the King and Martyr and St. Nicholas Acons for a faculty to grant a licence to the City of London Electric Light Company for the user of part of the burial ground of St. Nicholas Acons for the enlargement of a transformer chamber. The judgment is reported in the *Times*, July 16. It appears that the transformer chamber was to be erected extending a considerable distance beneath the burial ground, but that no part should be above ground. The top of the roof would be 3 ft. below the ground level and covered with earth, and it was proposed to plant shrubs on the soil covering the roof.

Section 3 of the Disused Burial Grounds Act, 1884, enacts: "After the passing of this Act it shall not be lawful to erect any buildings upon any disused burial ground except for the purpose of enlarging a church, chapel, meeting house, or other place of worship."

The main question in the case appears to have been whether the proposed structure built with brick walls and a roof was, if erected underground, "a building upon the burial ground." The Chancellor held that without doubt the structure would be a "building," and he further held that the Act dealt with one subject matter, and that was the entire burial ground, whether below or above the surface. This point appears never before to have been definitely decided in connection with the above Act. A similar question was raised in the cases of St. Nicholas Cole Abbey and St. Benet Fink Churchyard (1893, P. 58), where a faculty was granted in each case for excavation to be made in the churchyards and transformer chambers to be erected therein with ventilating shafts, but those cases were decided under two private Acts, and no reference was made to the Disused Burial Grounds Act.

Those Acts were passed early in the reign of Queen Victoria, after the Royal Exchange had been destroyed by fire, and under those Acts the burial grounds had been vested in the Corporation of the City of London, and certain portions of the churches were to be taken down, and portions of the burial grounds were to be used for street widening, the remaining portions to remain "for ever unbuilt upon," and only to be used for such ornamental purposes as the Corporation, with the consent of the Bishop, should think fit.

Those cases turned solely on a discretionary power, as no reference was made to the Disused Burial Ground Act, and in the case under consideration, the Chancellor felt himself unable to follow the decision in those cases, for he came to the conclusion that under that Act he had no jurisdiction to exercise a discretion if, as he found, the proposed structure would be a "building" under that Act. The Chancellor, in giving judgment, referred to the case Paddington Corporation *v.* the Attorney-General (1896, A.C. 1), and it was upon a dictum of Lord Halsbury in that case that he found himself unable to attach any particular importance to the word "upon" in section 3 of the Disused Burial Grounds Act.

In Paddington *v.* Attorney-General, a case reported in the Courts below, sub-nomine Boyce *v.* Paddington Borough Council, there was no question as to an underground structure. The churchyard was an open space within the Metropolitan Open Spaces Acts, 1877 and 1881, and a disused burial ground under the above Act, and under the former Acts it was held in trust for the perpetual use of the public "in an open condition free from buildings," except such as were permitted under the Disused Burial Grounds Act. The local authority had control over the churchyard as an open space, and they had erected a hoarding upon it to prevent the owner of land abutting upon and overlooking the churchyard from acquiring ancient lights in respect of buildings which he had erected. The owner of the buildings brought an action against the local authority and the Vicar, to restrain them from erecting this hoarding. It was held that although a hoarding in certain circumstances and under certain documents, such, for instance, as a lease, may constitute a "building," for the purposes of the Acts then being considered it was not a building, as under section 3 of the Disused Burial Grounds Act the erection must cover some portion of the ground, and the section does not refer to something in the nature of a fence or barrier erected to prevent the acquisition of prescriptive rights to light. The case may be appealed, and we offer no comment upon it.

FIRE DANGER AND HIGH BUILDINGS

The fire danger of skyscrapers is proved by the report of those who have been investigating this summer a serious fire that recently occurred in an hotel in New York. Fortunately the building, which was 38 stories high, was still in course of construction, or else there might have been serious loss of life, for the precautions against fire were not, it is stated, commensurate to the risks.

The building covered some 12,000 square ft. From the seventeenth to the twenty-third floors set-backs reduced the area to 3,000 ft., and then the building extended to thirty-eight stories above the street level. The floor arches were of cinder-concrete construction, with exterior walls of hollow tile. When the fire broke out the exterior of the building was practically finished, but there was considerable wooden scaffolding about. It was thought that possibly a tinsmith was using a charcoal furnace that was not properly extinguished. The fire raged for nearly nine hours, and burnt the hoist runways and scaffolding as far down as the thirteenth floor before it was extinguished. Steel columns, which had not been covered with fire-proofing, buckled, either because of the heat or because of the extra stress placed upon them. It is estimated that the loss is over £50,000.

The inquiry reveals the curious state of the by-laws of New York as compared with London. In spite of its height, there were no extinguishers in the building, a smoke-proof fire-tower, or other means to help the firemen to fight the fire. Nor was there a safe method of exit for the tenants of the building in case of emergency, for the building code of New York City does not require such an emergency exit in the case of residential and hotel buildings. "In business buildings exceeding 85 ft. in height, at least one stairway shall be a fire-tower. But in forty-story residence buildings, in use day and night, and housing sleeping quarters for women and children, such additional life-safety exit way is not deemed essential in the uppermost stories thereof."

The report concludes that the law "seems especially weak and inconsistent in this respect," and states that "the comparatively high and unjustifiable loss sustained in [illegible] instance recalls similar losses in buildi[illegible] under construction, and regretfully indic[illegible] that the lessons presented by those fires h[illegible] apparently gone unheeded."

We hear a good deal at these times of h[illegible] much the British building industry can le[illegible] from America. No doubt there is a good d[illegible] of truth in this, but at the same time, s[illegible] fires as this show what America can le[illegible] from us as regards measures taken for [illegible] safety of those who occupy buildings.

NEW BUILDINGS IN LONDON

Brixton Hill.—Building.—Messrs. T. Bennett & Son are architects for the [illegible] story building which is to be erected Brixton Hill, to abut upon New Park-roa[illegible]

Camden Town.—Building.—The St. P[illegible] cras Borough Council has approved the p[illegible] submitted by the Superintending Archi[illegible] for the erection of the North-Western P[illegible] technic on the western side of Kentish To[illegible] road, abutting on Prince of Wales-road.

Cornhill.—Rebuilding.—The directors [illegible] the Commercial Union Assurance Co., L[illegible] have decided, rather than restore the por[illegible] of the building in Cornhill, to pull down [illegible] remainder of the premises and to rebu[illegible] Mr. Maurice E. Webb, F.R.I.B.A., of [illegible] Aston Webb & Son, 19, Queen Anne's-g[illegible] S.W.1, has been appointed architect for [illegible] new building.

Dulwich.—Church.—Messrs. W. Wil[illegible] Ltd., are the contractors for a new chu[illegible] which is being erected in Lordship-l[illegible] Dulwich.

East Ham.—Houses.—Mr. J. Bi[illegible] borough engineer, has prepared the plans [illegible] the 12 double-tenements that are to [illegible] erected on the Flanders site, High-st[illegible] South, for the East Ham Borough Counci[illegible]

Fulham.—Nurses' Homes.—The Me[illegible] politan Asylum Board, at their Cou[illegible] meeting, recommended that approval [illegible] given, subject to the sanction of the Minis[illegible] of Health, to the erection, at an estima[illegible] cost of £31,010, of a new nurses' block at [illegible] Western Hospital, Seagrave-road, Fulhan[illegible]

Hammersmith.—Club.—The London Cou[illegible] Council recommend that, subject to the [illegible] sent of the Minister of Health, a site at [illegible] Oak estate, having an area of about 13,[illegible] sq. ft., be let on building lease to Subur[illegible] Social Clubs, Ltd., for the erection of a [illegible] and institute.

Hammersmith.—School.—A new school [illegible] to be erected at Hammersmith for the L[illegible] don County Council, and Messrs. Gaz[illegible] Kingston-on-Thames, have secured the [illegible] tract.

Hendon.—School.—The London Cou[illegible] Council has sold a site in Thirleby-r[illegible] Watling estate, Hendon, to the Westmin[illegible] Diocesan Trustees for the erection of a Ror[illegible] Catholic church and school. The site has [illegible] area of about 35,000 sq. ft.

King's Cross.—Exchange.—Tenders [illegible] being invited by H.M.O.W. for the erect[illegible] of an employment exchange at King's Cr[illegible] Plans have been prepared by the Archite[illegible] Department of H.M.O.W.

Marylebone-road.—Library.—A sum [illegible] £22,650 is to be spent on the erection [illegible] library on a site adjoining the Town H[illegible] The work is for the local Council.

Shoreditch.—Showrooms.—Messrs. Ya[illegible] Cook & Darbyshire, architects, have l[illegible] selected by the Shoreditch Borough Cou[illegible] to prepare plans for the new electricity offi[illegible] stores and showrooms. Tenders are to [illegible] invited as soon as plans are prepared.

Streatham.—Houses.—The Collett Build[illegible] Co., Ltd., are erecting 22 houses on a sit[illegible] Valley-road, Streatham.

(For rates of wages in the Building Trade in Scotland see page 638.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed, that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A Copy will be sent by return, and your Remittance refunded if the Book does : : not satisfy your requirements : :

Copying English Furniture.

An application was heard on Monday by the Board of Trade Committee under the Merchandise Marks Act, for an indication of the country of origin to be placed on imported furniture made wholly or mainly of wood, including upholstered furniture. It was made on behalf of a group representing the High Wycombe and District Furniture Manufacturers' Federation, the London Cabinet and Upholstery Trades Federation, the National Federation of Furniture Trades, the Yorkshire Employers' Federation, and the Furnishing and Allied Trades. Mr. Jacques Abady, for the applicants, remarked that of a large part of the foreign furniture imported into this country, it was not possible for the intending buyer to distinguish whether it was manufactured in England or abroad. Foreign manufacturers habitually offered to make and supply furniture to drawings and specifications which would be indistinguishable from English furniture. The Committee will report to the Board of Trade.

Sewerage Scheme for Ilford and Barking.

A special meeting of the Ilford Town Council has been held to consider the question of the sewage disposal of Ilford and Barking. The report of a special Committee which had conferred with representatives of the Barking Urban Council recommended that new sewage disposal works should be constructed on the Ripple Marshes in the Barking district on the line of the existing Thames outfall, and the necessary connections at present works and extended pumping station. The estimated capital cost of the works is £275,244, of which Ilford's proportion is estimated at £132,024 and Barking's £143,220. The proposed works would be controlled by a Joint Committee representing the Barking Urban Council and Ilford Corporation. Further recommendations were that the Ministry of Health be asked to approve the scheme and to sanction a loan for the proportion of the cost chargeable to Ilford; and that Messrs. W. H. Radford and Sons, of Nottingham, be appointed engineers for the construction of the works. After a long discussion the report was unanimously adopted

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Blantyre.—Memorial.—Plans for the proposed memorial to David Livingstone have been prepared. The property purchased includes the tenement in which he was born, the schoolroom he attended, and some nine acres of ground. The room in which Livingstone was born will be restored to its original form and refurnished as it was in his day. The cost will be about £12,000.

Dundee.—Houses.—Plans and sections of the following proposed building have been lodged at the office of the City Engineer :—Bank-street—alterations to cinema for the Kinnaird Picture House Messrs. Johnston & Baxter, architects, 31, Albert-square.

Dundee.—Housing.—A housing scheme is being launched by the Northern Housing Association, Ltd. The Association have submitted plans to the Works Committee of the Town Council for 88 two-roomed houses to be erected on a site being at Ancrum-drive, between Ancrum-road and Tullideph-road.

Balloch. — Bungalows. — The General Finance Committee of Glasgow Corporation are considering applications to feu about six acres fronting the Drymen-road on the Mollanbowie Farm, Balloch Estate. It is understood that the object of the applicant is to build houses of the bungalow type.

Edinburgh.—Slum Clearance.—The Dean of Guild Court has granted the Corporation, in connection with their Leith slum clearance scheme, warrant for the demolition of property at 21-25, Queen-street, and 8-11, Waterstreet. Other building plans which were passed include—Buildings at 19, Market-street for the Edinburgh *Evening News*, Ltd.; and seven bungalows at Comiston-road, for Mr. R. Robinson.

Renfrewshire. — Sewage. — The County Council are making application to borrow £22,065 for sewers and sewage purificati works in Williamwood, Clarkston, and Bus district.

Strichen.—Houses.—Plans and estima for the erection of houses in North-str have been approved by the Parish Coun

Tranent.—Houses.—The Town Council decided to build ten more two-apartm flatted houses.

CONSTRUCTION OF WINDOWS IN SCOTLAN

Intimation has been made by the To Clerk of Glasgow regarding a provision the Glasgow Corporation Order, 1927, wh comes into force on January 1 next, w regard to the construction of windows dwelling-houses. This Act provides, in effe that every window in a dwelling-house habitable room above the first floor mu unless there is a sufficient and railed balco be so constructed as to open inwards so t the window can be cleaned from the ins of the apartment. It is specially provid however, that the provision is not to ap to buildings erected or authorised bef January 1.

Historic Jedburgh Mansion House.

At the first meeting of Jedburgh To Council since the announcement of the p posed purchase of Queen Mary's Hou Jedburgh, for the town, Provost Cairns s he was sure it was the desire of the Cou to extend to Mr. F. S. Oliver, of Edgerst and Mrs. Oliver their warmest thanks and preciation for their generous offer to p vide the purchase money for Queen Mar House, and thus secure the ancient historic building for the town.

French polishing	„ „	1	2
Preparing for and hanging paper	per piece, 2/- to 4/-		

*These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10 % on the prime cost without establishment charges. A percentage of 1¼ should be added for Employers' Liability and National Health and Unemployments Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

TRADE NEWS

A Simple Door-Fastener.

Messrs. C. Love & Sons, of Bembridge, Isle of Wight, have placed on the market a neat and simple form of door-fastener, the "Odooro"—an invention of Sir John Thornycroft—which dispenses with latches. The "Odooro," it is claimed, eliminates slamming and rattling of doors, securing them lightly or firmly by the pressure of a spring neatly and easily fitted to any door, cabinet, cupboard, garden-gate, casement-window, etc. An illustrated folder will be sent upon request to the makers.

Lightning Conductors, Steeplejacks and their Work.

This is the title of an interesting little publication issued by Messrs. W. J. Furse & Co., Ltd., of Traffic-street, Nottingham, and containing a lecture given by the firm's engineering manager, Mr. G. A. Collier, on these subjects. The lecture, which is fully illustrated, is on a subject that most people seem to find very fascinating, and a copy will be sent to anyone interested upon application to the Head Office at Nottingham.

Change of Address.

Messrs. L. & W. Whitehead, Ltd., building contractors, are removing their offices from Portland Works, 2, Portland-place North, Clapham-road, S.W.8, to larger premises at 169, Clapham-road, S.W.9, and from now on all communications should be made to the latter address. The joiners' machine shops and general yard will still remain at the former address. The telephone numbers will remain the same, viz., Brixton 4020 and 4021, with extensions to all departments.

The Midland Bank Head Office.

In connection with this building, illustrated in our issue for October 7 and described on page 551, we should have stated that the fibrous plaster and solid work in the main banking hall was carried out by Messrs. G. Jackson & Sons, Ltd.

Scottish Housing and Building Exhibition, 1928.

We learn that this Housing and Building Exhibition—which will be the third—will be held at the Waverley Market, Edinburgh, from February 18 to 29, 1928. This exhibition, which is under the direction of Mr. T. Percy Bentley, is steadily growing in popularity in Scotland and provides a good setting for manufacturers. The promoter's address is 7, Waverley-market, Edinburgh.

A Catalogue of Doors.

Messrs. Joseph Sandell & Co., Ltd., of 101, Waterloo-road, S.E.1, have issued in a neat and handy form a catalogue of their various doors in timber—known under the mark of "Topaz." Many styles are displayed for all purposes: front, back, and garage doors, and also garden gates, casements, and a variety of kitchen furniture. All doors are of the best Swedish quality. The catalogue—as also the list dealing with the firm's clean mouldings—will be sent upon request.

Public Baths, Bermondsey.

We learn that for the roofs of these baths, illustrated in our last issue, "Hy-Rib" reinforcement was used. This is supplied by the Trussed Concrete Steel Co., Ltd., of 22, Cranley-gardens, S.W.7.

Catalogues Required for Nairobi.

H.M. Trade Commissioner in East Africa, Colonel W. H. Franklin, C.B.E., D.S.O., is desirous of receiving catalogues and price-lists from United Kingdom firms engaged in the manufacture of agricultural and other machinery, engineering lines—including electrical—hardware, pottery, and glassware. Catalogues may be sent direct to H.M. Trade Commissioner in East Africa, P.O. Box 220, Nairobi, Kenya, but the Department of Overseas Trade, 35, Old Queen-street, London, S.W.1, will be pleased to assist should any firm require further information as to what is required. Reference 19928/1927 should be quoted by applicants.

Travelling Exhibit of Radiators.

The travelling exhibit of the National Radiator Co., Ltd., of Hull, fitted with a working installation of the "Ideal" Cookan-heat and "Ideal" Classic radiators, will demonstrate from October 21 to 26 at the Grand Hotel Yard, Barkers Pool, Sheffield.

New Public Baths, Bermondsey.

We are informed that the whole of the decorative metal work on this building was carried out by the Birmingham Guild, Ltd., comprising area railing, railing to first-class baths, staircase railing, entrance-hall barrier, bronze rails to plunge, and commemoration panel in entrance hall, etc.

PATENTS

APPLICATIONS PUBLISHED.*

245,122.—J. W. Thompson: Concrete building constructions.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXXIII. No. 4421. OCTOBER 28, 1927.

RIGHT BUILDING.

WITHIN recent years intelligent comment upon architectural matters has become the rule rather than the exception in the better class lay Press, and it is a pleasure to follow the lead of the *Observer* in a protest against the despoiling of the upper reaches of the Thames by the generally ugly buildings which modern indifference and haste have admitted alongside some of its most beautiful banks. In the course of a description of one typical group of bungalows, our contemporary recently said:—

> "It is a collection of about a couple of dozen bungalows, having all the possibilities of absorption into the scheme of things but one, and that one spoils everything. Plenty of money has been spent on them. They have all the dainty paraphernalia of river attractiveness in window treatment, flower boxes, beautiful—even lavishly expensive—gardens, creepers, trees, topiary work, brightly painted steps and gay terraces. But they are almost one and all disfigured by a horrible flat roofing of a vivid pink, that will not weather, and that is, in spite of all the flowers, trees, and expenditure, an affront unless and until it has been painted in more suitable tones."

We quote the passage *in extenso* as a mark of welcome to an artistic sensibility which can no longer be considered the monopoly of a professional hierarchy; and we acknowledge gratefully the specific clarity with which the subject is attacked.

Now it would be wrong and foolish to demand that the gay and evanescent spirit of the riverside must be expressed by the builder only in permanent and traditional building method, but it is no more than good sense to call for that respect for form and colour which alone can produce comely structure. Time was when the builder sought a cheap romanticism with battlements, pinnacles, oriels and turrets stolen from a totally different and distant age. The battlements might have no relation to battles: the pinnacles might have no purpose for loading a buttress: the oriels might have no view to catch, and the turrets might house not bells but tanks. Yet, because they existed in an age we regard as romantic, they had to be transplanted to create romance afresh. We have to some extent grown out of such nonsense, but there is still a deal of humbug to be dissipated. The red roof of the old-world cottage is not beautiful just because it is red, but because its effect grows out of an honest use of an honest material. In their places, and seen against the background of landscape, the grey and green slate, the stone slab, the wood shingle, and the bonnet of thatch, can each make its own appeal. All that is needed is a tasteful handling of the material selected to make it a thing of beauty. No material need be ugly if it is so treated, be it weather boarding, or asbestos sheeting, or concrete slab. Let the week-end bungalow remain slight and temporary if you like, but let its form be simple and direct, and let its colours merge into the background of woodland and mead. Let the structure, in fact, bow respectfully to Nature, who must surely reign supreme along our lovely river banks.

It is because we have lost that unsophisticated honesty which was once the birthright of the country builder that we can no longer get at these things in a natural way, and the bad taste which abounds is simply the evidence of ignorance and incompetence, which will continue so until the public demands something better. This desirable outcome will arrive so soon as the public knows what it needs and what it really wants, and this will probably be not until it is actually told in convincing fashion. And here is the chance for the Press to exercise its great educational potentialities. It has been said that education opens the door to all reasonable possibilities, and such a statement errs little on the side of exaggeration. Education needs but the inspiration, the determination and the directing force to perform its wonders. It is useless to hope for an entirely artistic community, but education, by directing those to whom the beautiful has a real meaning, can do much to set a standard of good manners for its more obtuse members. There is something of a parallel in a tasteful choice of clothes. It is not everybody who has the eye sufficiently sensitive to appreciate the subtleties of line and style which mark the well-dressed man. Yet there are very few middle-class men who are content to assume a ready-made suit, and they prefer to pay anything from fifty per cent. upwards more for clothes which are specially designed for them by a skilled artist to suit their individual cases, and to respect a common fashion of some discrimination. Public opinion has set a standard below which they are loath to sink, and the result is a very tolerable average. Yet these same men are content with the veriest reach-me-down when it is a question of being fitted for a building; and public opinion seems neither offended nor amazed (apart from the sensitive few), because public opinion is so little educated in the matter. Until recently, it seems to have assumed as inevitable that reasonably economical building must be fundamentally ugly: that beauty is a matter of expensive trimmings, which, when absent, leave nothing but an unsightly carcase. It will continue thus until public opinion grasps the truth, that beauty in building is essentially a matter of mass and form, and that no amount of beautifully designed ornament can disguise an ugly form, as no degree of simplicity can impoverish a simple and graceful form. These are the axioms of architectural understanding and sympathy: these were the inspiration of the village church, the country cottage, and the moot hall, as well as of the more widely known works which have been passed down to us as classics. The public has only to appreciate this and respect it to initiate a standard of modern architecture worthy to follow the past.

The technical Press has some opportunity of direct contact with the lay public, but its influence in this direction is somewhat limited and largely dependent upon the sympathy and goodwill which may exist among brother journalists of the lay Press. We should be foolishly mock-modest if we pretended to believe that the quiet propaganda, in which the BUILDER has been engaged for many years towards a better understanding between architect, builder and layman, has borne no fruit at all; but we welcome unreservedly this evidence, which we have quoted above, of a specific exercise of public education on the subject of decent building as distinct from more pretentious or monumental architectural efforts.

NOTES

Modern Architecture and Reinforced Concrete.

The development and use of ferro-concrete has inevitably raised some serious questions of design in modern architectural work. The protest by Mr. Gilbert Jenkins in his presidential address at the A.A. on Monday last will arouse varied feelings amongst architects. It is natural enough that those who have been nursed in tradition and hold to it as to a sheet anchor of safety, look askance at the bald and uninspiring effect of ferro-concrete buildings. But we cannot disguise from ourselves the fact that the conditions of life are changing fast. Whether they are for good or ill time alone can prove, but theoretically the case for the adoption of ferro-concrete is made out, whilst we have yet to learn that architects can meet it with the interest and charm of our traditional work. Our artistic instincts may be half drowned in the sea of commercialism which floods our life to-day, and we can only hope that we may rise on the ruins of our dead selves to better things.

Revived Styles.

Sir Reginald Blomfield is a trenchant writer, and his letter to the *Times* of the 17th inst. is in his best fighting form. He hammers the "revived Gothic" of Oxford as not moving freely in its armour, and pleads for a "mastery of architecture as a vernacular art." As a champion of a living expression of our modern needs Sir Reginald will be very welcome. Probably he would tell us that this is the ideal which he has consistently upheld, since a Renaissance is not a single re-birth but a constant revival of energy springing anew from a parent stem. Nevertheless, there has been confusion of thought between him and the "Modern" school, with consequent bewilderment to the layman. This letter should help to clear the issue, and serve to convince the layman that modern architecture must have its own impress whether evolved, as Sir Reginald would prefer it, through Renaissance principles, or created by a marriage between the æsthetics of engineering and the functional demands of the building. Executed with responsibility and scholarship, either means may produce living architecture.

Training of Architects.

There is much sense in the comments on Sir R. Lorimer's letter to a contemporary made by Mr. E. E. Lofting, in which he reminds us of the statement that we can only hope to get sane and logical building when young architects are trained through the shops like engineers and builders, etc. The want of contact with materials, and the consequent inability to appreciate their right working, leads to the office design, that lifeless alternative to the demands of a really corporate craftsmanship. So we suffer from an architecture without craftsmanship, unless we honour the substitute which has taken its place with that name. Nothing could be more depressing than the usual additions of ornament, to which we have become accustomed, and which do duty for the real thing. We could point to the external ornament on a recent prominent London building as an example, yet how much is the need of real feeling and vision to-day. And there is nothing to prevent the presence of something better except, on the one side, the architect's want of effort to obtain it, and the indifference of the public, who have become used to such alternatives, on the other. Yet there are plenty of good craftsmen, only they are so little employed that it becomes almost an event to hear of an artist employed in such a way. The approach is wrong and adds to the difficulty because there is not yet the more natural, mutual co-operation as artists together, between the architect and the craftsman. This is not, however, the whole of the matter. We have industrialised ourselves away from the simpler relationships that go to the best results; and the difficult conditions under which the architect works at a time when commercial demands are so insistent have to be remembered. We have none the less as architects and artists to become more used to each other, not as employer and employed, but as artists working together, understanding what is due to each other's difficulties, and forgetting our fancied prerogatives for the sake of fine building.

Minimum Salaries.

The claim of the Association of Architects, Surveyors and Technical Assistants for the adoption of a minimum salary for qualified assistants naturally arouses one's sympathies. But to those who believe in a real freedom of action, there will also naturally be felt an objection to force people to pay any fixed wage for services rendered. The Association which is seeking to benefit assistants may reasonably claim that as architects make a fixed demand for a certain payment of fees, whatever their real qualifications may be, so assistants may well ask for some fixed rate of pay. The twenty shillings one earns to-day is not the twenty shillings of pre-war days, and if, for instance, in the time to come

Old Hall at Wool, the Home of the D'Urbervilles.

Mr. A. E. Henderson, F.S.A., L.R.I.B.A., Architect. (*See page* 647).

has even less intrinsic value, so the inimum payment to be called for -day may conceivably be too little ereafter. But we all are either the ictims or the beneficiaries of Trades Inionism to-day: we cannot even exempt he architectural profession from its uses, it would perhaps be no real hardship, nd might be only even-handed justice, fix a minimum wage for architects' nd surveyors' assistants. After all, we re not compelled to employ those who re really unskilful, and we always emember an architect lamenting to us hat he had engaged a tracer at one hilling an hour instead of employing one t two shillings!

Settling it over Our Heads.

The tendency to pontifical utterance is encouraged by the docility of the average, the modesty which finds something sacrosanct in the utterances of the expert. Now we hear hat all artists have declared T. Roussel's icture "The finest nude in the world." This was said some years ago with equal certainty of "The Mirror of Venus" by Velasquez. It could surely be placed in he Tate Gallery without carrying it on he wings of so much inflation. We are eally tired of these final judgments on Waterloo Bridges and artists' pictures vhich multiply themselves to their own ndoing. We are sure, could they do so, oth bridges and pictures would blush t thus being thrown at our heads, and vould prefer a more temperate admira- ion. Who is to challenge this magis- erial saying about Roussel's "nude"? nless it be the artist less prone to dog- natism. This pontifical "what I don't now isn't knowledge" sort of attitude s bad criticism, and becomes very tire- some, and there is need of more pro- portion in statements on matters of public interest. Does not such extravagance of language rather suggest there is a doubt about it? T. Roussel's picture is quite good enough without all this hoisting.

Gardens.

October is a month of intense activity to gardeners, and no one can pass the rows of bent backs in suburb plots without realising how greatly the love of gardens and of flowers has increased in the present generation. In stately England the gardens of the rich were for too long a matter of organised formality, of shrubberies, sculpture, vistas and ribbon borders. They lacked the intimacy of earth, the homeliness of personal labour. Now "naturalism" runs riot, foolishly so with the parvenu, genuinely with the man who gardens for himself. Even the cheap bazaar specialises extensively with supplies of seeds, bulbs and rose bushes; no one need lack material for colour and scent. As a result every architect can hope that, however hideous the occupier may make his house within, at least outside he will see it set in a garden that is kept up and beautified by personal care and labour.

A Complimentary Dinner.

We have pleasure in announcing that a complimentary dinner will be given on November 17 to Mr. C. F. A. Voysey, on account of his services to Architecture and the Allied Crafts. Mr. Voysey has been a vigorous influence in the modern world of architecture, and many will be glad to share in this public tribute. Those who would like to attend the function should apply to the R.I.B.A., at 9, Conduit-street, W.1.

Lych Gate, St. Crispin's Church, Mashobra, Simla Hills, India.
Mr. Bernard Matthews, F.R.I.B.A., Architect (*See pages* 649, 650, and 653).

GENERAL NEWS

Professional Announcements.

Mr. Percy C. Boddy and Mr. John A. Dempster having dissolved partnership as from October 19, 1927, Mr. Boddy will continue to practise from 19, Palace-street, Westminster, S.W.1, and Mr. Dempster will practise in future at Wallington, Surrey.

Mr. J. Mukharji, F.R.S.A., F.I.B.D., M.F.A., Superintendent of the Sri Pralap Technical Institute, Jammu, N.W.R., Kashmir State, India, has been elected a member of the National Federation of Master Painters and Decorators of England and Wales.

Mr. S. B. Caulfield, F.R.I.B.A., has removed to 15 and 17, Baker-street, W.1. Telephone : Langham 3697.

New Skyscraper for New York.

We understand that plans have been completed for the erection of a fifteen-story building in West Broadway. It will be the largest structure in the world devoted exclusively to telegraphic business. It will cost £1,200,000, with an additional £200,000 for bringing the telegraphic wires and pneumatic tubes into the building.

Old Tudor Hall at Barnet.

The Tudor Hall of the Barnet Grammar School, an Elizabethan foundation which is to be superseded by a county secondary school, will, it is expected, be purchased by the Visitors of Jesus Hospital Charity (a local charity) for preservation and use for all time. The transaction is not yet completed, says the *Times*, but there is a confident hope and belief that the hall the most treasured architectural possession of this historic town, will be saved from the demolition which awaits the modern classrooms when the new school is erected elsewhere.

Southend-on-Sea and District Society of Architects: Proposed New Society.

We have received a letter from Mr. D. N. Martin-Kaye, A.R.I.B.A., hon. secretary, Southend-on-Sea and District Society of Architects, in the course of which he refers to certain decisions which have been made by the Council of the Southend-on-Sea and District Society of Architects and ratified by the general body of members. The Council have at their last meeing agreed in principle to the formation of the Essex Society of Architects and steps are being taken to convene meetings in the near future at Romford, Chelmsford and Colchester, with a view to setting up branches with the Southend Society of a federal organisation to be known as the Essex Society of Architects. This body will, it is hoped, be affiliated to the R.I.B.A. The first annual dinner of the Society will be held on December 15, at Southend, and Mr. Walter Tapper, A.R.A., President of the R.I.B.A., has promised to be present, and it is hoped to make this occasion the first rallying point of the new Society. Any Essex readers who would be willing to support the formation of the Essex Society should write either to Mr. MacAlister, secretary, R.I.B.A., or to Mr. N. Martin-Kaye, at the School of Arts and Crafts, Southend.

Redecoration of Euston's Great Hall.

The Great Hall at Euston Station, reputed to be the largest waiting-room in the British Isles, has been recently redecorated. The hall, which is 128 ft. long by 62 ft. wide and 64 ft. high, and was built from the designs of Hardwick, was previously lit by gas, and an important item in the new scheme has been the installation of electric light; moreover, the hall is now "flood lit" at night by high-power lamps under each window.

The tall columns which surround the hall have been painted in imitation of red Egyptian porphyry, as have also the walls as high as the balcony. The capitals and bases of the columns have been coated with gold leaf, and the ceiling has had three coats of white lead paint. In each corner there are a pair of bas-reliefs representing Birmingham, London, Northampton, Chester, Manchester, Carlisle, Lancaster, and Liverpool, each of which is 10 ft. by 7 ft. in size. In frames around the hall have been placed a number of the London Midland and Scottish Railway Company's art posters, ingeniously treated to resemble the originals.

The redecoration of the hall has been carried out entirely by the company's own staff, to the design of Sir Edward Lutyens, R.A.

Mingling of Oriental and Western Art.

Sir Banister Fletcher, F.S.A., F.R.I.B.A., gave, on Wednesday last, a lecture at the Central School of Arts and Crafts, on the Romanesque buildings of Northern and Southern Italy. In the case of Southern Italy and Sicily, he said, architecture and history were so interwoven that no one unacquainted with the one could understand the other. The architecture of Sicily was a rich mingling of the art of east and west and of successive civilisations. Historical development often determined definite architectural characteristics, but here it had given us variety in unity. In Sicilian churches we stood amazed as we realised the Greek origin and the Roman plan, crowned by Byzantine domes lined with Mahometan mosaics, to all of which much Norman detail was added.

Everywhere in the styles of the buildings we could see the impress of the seals, not only of successive conquests, but of varieties of religions. Byzantine influence predominated in La Martorana at Palermo, with its crowning dome. Monreale Cathedral, which was a Roman basilica in plan, with Byzantine wall mosaics, had an entirely Saracenic colour scheme in the roof, while the Norman rule was reflected in the beautiful Romanesque cloisters with their coupled columns and stilted arches, inlaid with rich mosaics from the Palace school. The gem-like Capella Palatina glittered with Byzantine mosaics and glowed with Mahometan colour, while the mysterious richness of the roof was enhanced by the Saracenic stalactite pendants and honeycombed intricacies. Thus, through changes of government and under alien masters, the architecture of Sicily was ceaselessly carried on by mason and carpenter, with varied decorations by painter and worker in metals and mosaics.

Cast-stone Brackets, New Chancel, Forty Hill Church, Enfield.

PRESIDENTIAL ADDRESS.

An ordinary general meeting of the Architectural Association was held at 35, Bedford-square, London, W.C.1, on Monday evening last, Mr. Gilbert H. Jenkins, F.R.I.B.A., the President, in the chair.

A vote of condolence, moved by the Hon. Secretary, was accorded the relatives of the following, who had recently passed away :—Messrs. L. H. Glencross, J. H. Kerner-Greenwood, P. W. Farmer, Andrew Oliver, Henry Lovegrove, S. E. Knott, and F. G. Minter.

The President, in his address on "Modernism in Architecture," said it was a pleasure to state that they were still breaking records, their premises were being enlarged, and soon their headquarters would possess most of the amenities of a modern club. The school was being extended, and they would soon have accommodation for 240 students, all housed in new buildings, with an enlarged lecture-room and other improvements.

Referring to the recent A.A. Excursion, the speaker said they were officially received and most hospitably entertained by the architects and the municipal authorities of Prague and Vienna. Professor Reilly had promised to give a lecture on the subject at their next meeting, illustrated by lantern slides of Mr. Yerbury's photographs. In both places they saw architecture, both old and new, and possibly it was the complete contrast between the fine Gothic and Baroque architecture of Austria and the newest buildings they saw that had made him decide to attempt an analysis or review of modernism in architecture. Whether this fashion in scientific building would ever develop into an art and rise to the dignity of a "style," or in the next decade be looked upon as a passing craze, was a matter of doubt. During the excursion one heard of an exhibition of modernism in architecture then being held at Stuttgart, where not only drawings and photographs were on view but also a complete garden suburb, designed by the most eminent practitioners on the Continent, to demonstrate the excellences of the new expressionism in art.

Before the war the older fashioned among them tended to look backwards and to revive the fine 18th century traditions and artistic products which the commercialism, machine production and scientific discoveries of the 19th century had caused them to forget. They believed that by reverting back to the tradition of the 18th century they would attain to something finer than if they were to throw over the results of centuries of patiently accumulated endeavours to improve their art. Art must have some source of inspiration, and it became a question as to whether past achievements should form the stepping-stone to greater architecture, or whether they should reject all they had learnt during the last two or three thousand years, and attempt to start from the beginning. If a new style was to be achieved, one good building would not make a style, nor would one great architect, unless others were content to learn from the work of the master mind, adding good things of their own, until a school had been built up and had extended its influence through all the subservient arts. History seemed to show that all the greatest examples of architecture were the product not of one mind or one age, often not even of one race, but of the slow growth and betterment of a style through many decades.

Continuing, the President said when he was a pupil, Norman Shaw was at the zenith of his powers. He started by giving them a clever admixture of Gothic and Renaissance with its novel reuse of red bricks, tiled roofs and sash windows in small squares, coupled with picturesque composition and original detail. He thus did more to kill the Gothic revival in domestic architecture, and the stucco or stock-bricked and slated Victorian style of house than any architect since the Georgian era. It opened the eyes of his contemporaries to the beauties of old English domestic architecture, while striking an entirely new note. Bedford Park, in those days, was quite a famous suburb of London. The new style was mistakenly dubbed "Queen Anne," but Shaw, as he grew older, came to love the real Queen Anne work of Wren and his followers, and took up again the threads of the English tradition of the end of the 17th century. Shaw travelled and sketched all over Central and Southern Europe—he was a brilliant draughtsman, with a wonderful catholicity of taste, but, although some of his earlier work, such as the insurance building at the corner of St. James's-street and Pall Mall and his New Scotland Yard, was influenced by foreign ideas, his more mature style was essentially English in tradition.

Shaw had pupils and admirers who carried on the tradition he had refounded—a school of ideas into which Sir Edwin Lutyens and others were still infusing new blood. It was this school which revived domestic architecture in this country. Its exponents taught the public that good composition, simple massing, pleasant fenestration, refined detail and well-chosen materials produced a better house than the so-called picturesque grouping and fussy features. Thus, before the war, instead of England going to America or the Continent for ideas, the whole world was coming here to study how a house should be built and set in the landscape, and whatever our shortcomings in public buildings might have been, we at least had a style in domestic architecture of which any country might be proud.

The apostles of the new creed of "modernism" in architecture were attempting to set up new standards which, if they were to be judged by the work actually finished on the Continent, derided every accepted canon of grouping, proportion, sense of structure, relation of solids to voids, and the use of mouldings or ornament of any kind. In this new style, flat roofs were *de rigueur*, the floors pushed themselves out through the walls and overhung the facades, an idea which the designers considered must be brilliant, as it had never been done before. It was so easy to do in ferro-concrete and marked the architect as being a "real live man." In the large blocks of flats, windows formed a horizontal gash running from staircase to staircase, where the fenestration was carried in huge vertical slits from basement to roof, to prove that no ties in the front, either vertical or horizontal, were required.

Continuing, the President said their stay in Prague was too brief to see the housing schemes in the suburbs, but, from a distance, these appeared to be on English garden city lines. However, they were shown the post-war commercial work—a store fronted with plate-glass from pavement to roof, another looking like a brick box with the lid off, also a ferro-concrete block of offices with the windows in slits between the piers, while the latter supported angular consols which carried the square-edged slab of concrete, taking the place of the cornice. The Czechs and Slovenes had a fine tradition in painted internal decoration which, fortunately still continued, so that the interiors of th new middle-class houses had a charm an interest which were apparently lacking i the new building works, where architectur seemed to have been forgotten. A huge fa building was being erected with enormou spans, all in ferro-concrete. It was a fi piece of simple planning, the restaurar below the main ground floor having a dignit of effect from its good proportions and th rhythm of its concrete piers and beams. A this was in the crude concrete structural stat and as an engineering feat the designer ha good reason to be proud of his achievemen When the drawings for the elevations we examined they proved to be the usual strip of concrete alternating with iron-framed plat glass.

A scheme for new municipal offices w recently the subject of competition in Pragu and an astonishingly new design won fir place and, apparently, was to be erected ferro-concrete. This allowed the designe to place his main piers inside and to mak his elevations a sort of ribbed screen in whic four bastions, somewhat resembling skelet gasometers, were the main features. Th intermediate bays were horizontal strips glass and concrete, the top story being ove hung to line with the outer edges of th bow-shaped towers.

The exhibition galleries at Stuttgart, whe a halt was made, certainly impressed visitor They consisted of a series of canvas-line boxes, where drawings and photographs the latest schemes in the new manneris were displayed, tending to show that the d signers were determined to be original. ferro-concrete was at least a material f which there were no known precedents, th designers had seized on it as being mo likely to serve their ends than any othe The crushing weight of the new material w very high, whereby supports might be r duced to a minimum. Beams, on the oth hand, had to be deep and heavy, but b moving the supports from the ends an cantilevering out, this difficulty might partially overcome. Consequently, no visib vertical supports were required on the face these structures, which could be designed show only the front edges of the floor or ro slabs, and there was no need even to pu supports at the angles of the building. Th result was that nearly all this modernist wo was a combination of cubes or parallelepip don, variety being obtained by making th latter of all shapes and sizes. In one desig a tower was put up on four legs with plat glass enclosures, the top story hung out both sides, making the whole of this origin composition for a building look like a b water tower, despite the fact that it w something else.

In another design a tower of twenty stori or so had one very solid side from whic were projected the floor slabs on which dwa partitions, with lightly iron-framed glass alternate layers, were erected on the oth three sides, the effect resembling a con set up on end.

If the washhouses of a block of dwellin in Stuttgart had not been seen, the crit would have been puzzled to know how th building could possibly stand up. Investig tions, inside one of the houses, showed a fi stout concrete pier in the middle of the roo to carry the flat, which was hopelessly in th way of anyone using the room to work in. French exponent of modernism had built concrete and plate-glass box to form one these new abodes, consisting of ferro-concrete box with thin wall, roof a floor slabs perched on stilts with an op basement to ensure its coolness in winte The main living room was two stories height, with plate-glass windows filling o wall. A stout concrete pier faced with enormous radiator was the most interesti feature of this curious apartment. Up anoth wall ran the stairs in a continuous line the second floor. To ensure novelty it w only 2 ft. wide, and had a solid newel w nearly 4 ft. high. A half-landing led to gallery, on which were placed the princip

, bathroom and W.C. The partitions y 5 ft. 9 in. in height—to have carried to the ceiling would have destroyed l effect. The steps were in blue tiles, rs of patent composition, and the nd tables of polished nickel-plated earing cowhide seats and backs or wood tops. Severely simple enam- nents and cupboards, fitted lavatory nd painted walls and ceilings, com- the hospital-like effect. This abode signed by an architect of European on for his efforts in modernism. ly the organisers of the exhibition had ualms when they saw these creations ed, for the most frantic endeavours n made to distract the ordinary visi- tention from the building by laying umerable terraces, grass plots, paths iers ablaze with flowers.

ould admit that modernism was ex- scientific and logical, enabling its ts to adopt many new forms of ex- in building. Unfortunately, its oners had forgotten that architecture n more an art than a science. The otion produced was sorrow at the per- of so many clever designers who had an ungainly material in which to ut their deliberately ugly creations.

he roots of modernism were firmly in ferro-concrete, it might be as well nine the advantages or disadvantages hitect could obtain by adopting this l for his work. The objections to ncrete when used for architecture asily be detailed under the following —Colour, form, suitability as a build- terial, lasting qualities, ease of erec- ssibility of easy alteration. The colour ly and became still more ugly with he material being erected in shutter- noulds, the resulting forms were coarse cked refinement. This might be no nt to engineering works, factory build- even monumental structures having scale, but in many classes of buildings ould be little or no scope in express- r purpose, unless materialism was the rit of the age.

gards the suitability of ferro-concrete ilding material, this was a nightmare architect, who has no real control over the work. He found his engineer, district surveyor, and the contractor eternally quarrelling upon different theories of stresses and strains, whilst the work was very slow, owing to the time allowed for the various stages to set before the centering could be struck and the piers and beams could be loaded with the superstructure. It was impossible to fix anything into it without great cost in cutting away and the chance of destroying its efficiency, and all the services had to be run on the surface, to the detriment of the internal decorative effect. Piers and beams were entirely encased during execution, and no one could say that solidity had been attained. Grave defects were apparent when the building was occupied: owing to its extreme hardness and rigidity, floors and walls acted as sounding-boards; external walls and roofs had to be cased to prevent sweating in damp weather, as it was so good a conductor of heat and cold, and steps had to be taken to isolate the external walls and roofs to prevent abnormal heat losses in winter and acute discomfort in summer. Its lasting qualities had yet to be proved. The havoc wrought by the expansion of rusting iron on the west front and towers of Peterborough Cathedral was common knowledge. One also knew the difficulty there was to prevent large concrete floors gradually developing wide cracks. Some said that the surface must be kept wet for several days if cracks were to be avoided, others that any surface over 50 ft. super. in area would crack unless a rubber strip or other means were adopted to disconnect completely one section of pavement from the next. It seemed reasonably certain that sooner or later ferro-concrete work would develop cracks, and it was then only a question of time before the steel would rust and burst the concrete.

An eminent engineer referred to ferro-concrete as the doctrine of the "If," explaining that there were so many ways in which the erector could go astray that it became a marvel if perfect work was produced. There were so many "ifs" that an architect's life was too short and full to take the responsibilities, while a clerk of works might be an excellent supervisor of all ordinary building work and yet might not understand the importance of every one of those "ifs." Apart from that, a ferro-concrete building must be much slower in erection than a steel framed building, and thus, on valuable sites or in large commercial undertakings, it must involve the waste of a considerable amount of capital, while, if holes were to be cut through floors, the hardness of the material made the cutting away very costly.

Mr. Stanley Hamp, in proposing a vote of thanks, said they were always talking about a new style, but he was sure if they had one it would not be a new style but the process of evolution. He wished that some of the competition assessors would have the courage to select something which really had a new expression. Unless the assessors rose to the occasion he did not see any chance of striking a new note. The President had suggested that reinforced concrete was a material that should not be used, and that it had no lasting qualities. He said he had in mind an enormous factory building for motor-car manufacturing in Turin, running round the top of which was a small "Brooklands." It was a very large building, the fenestration was exceptionally good, and for its purpose he (the speaker) contended it was good architecture.

Mr. Howard Robertson, seconding the motion, said the restlessness which Mr. Jenkins mentioned as a product of this age was perhaps another word for vitality. Nothing which was any good in building had ever been definitely neglected, and in adopting ferro-concrete he did not think they had seized upon it as a mere handle, but as a building material suitable to their present-day economies and wants, which enabled them to do in a simple way things which were complicated under the old methods of building.

Mr. Robert Atkinson said he found it easier to do something traditional, and usually did it. At the same time traditional work was not always good. He considered that traditional work was really the backbone of any architectural composition, and if anyone could do work which was really modern and really good they would all like to see it.

The President, in reply, said he did not advocate revivals. To him revivals were loathsome things in architecture.

Path through woods to St. Crispin's Church, Mashobra, Simla Hills, India.

MR. BERNARD MATTHEWS, F.R.I.B.A., Architect (*See page* 653).

SOCIETIES AND INSTITUTIONS

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The Board of Architectural Education announce the following awards of R.I.B.A. Maintenance Scholarships in Architecture :—

The R.I.B.A. Fourth and Fifth Year Maintenance Scholarship.—This scholarship has been awarded to C. J. Bartlett, of the School of Architecture, The Technical College, Cardiff. The scholarship is of the value of £100, and is tenable for two years in the fourth and fifth year courses at a School of Architecture recognised by the R.I.B.A. by a student who has already completed satisfactorily a three years' course in a recognised school.

The A.G.B.I. Maintenance Scholarship.—This scholarship has been awarded to J. F. D. Wylson, of Whitstable, Kent. The scholarship is intended to enable the son or daughter of an architect or artist to attend an approved course at one of the Schools of Architecture recognised by the R.I.B.A. for the purpose of exemption from its examinations. The scholarship is £100 in value for one year, and is renewable for two further periods of one year each.

Six scholarships were awarded in July, 1926, and five of these have been renewed for the academic year 1927-1928. The reports from the schools show that the students are benefiting from the opportunities afforded to them. The scholarships supply a need in the architectural profession, and it is hoped in future to be in a position to award scholarships to a total value of about £1,000 annually. With this object in view a capital fund has been started, which it is hoped to increase materially, and it is also intended to found more fourth and fifth year scholarships to enable promising students to continue their architectural education for longer periods.

Exhibition of Designs of Students of Schools of Architecture recognised for exemption from the R.I.B.A. Final Examinations.—These designs will be exhibited in the R.I.B.A. Galleries, 9, Conduit-street, W.1, from October 24 to November 4 inclusive, from 10 a.m. to 8 p.m. (Saturday from 10 a.m. to 5 p.m.).

The R.I.B.A. Board of Architectural Education Silver Medal for Recognised Schools is awarded for the best set of drawings submitted. This year the following schools have sent exhibits :—

School of Architecture, The Architectural Association.
School of Architecture, University of Liverpool.
School of Architecture, University of Manchester.
School of Architecture, Robert Gordon's Colleges, Aberdeen.
Glasgow School of Architecture.
School of Architecture, Edinburgh College of Art.
Bartlett School of Architecture, University of London.
School of Architecture, McGill University, Montreal.
Department of Architecture, The Technical College, Cardiff.

NORTHERN ARCHITECTURAL ASSOCIATION.

Mr. J. H. Martindale, F.R.I.B.A., in his presidential address at the opening of the sixty-eighth session of the Northern Architectural Association, held at 6, Higham-place, Newcastle, said that the true architect was the man who not only could design beautiful buildings, but was able to erect those buildings, even if out of nothing, substantially and with sound commercial discretion. He also dealt with the past and present methods of planning and ing. Dealing with the question of planning, he said that the main objec get houses in which people can live c ably and healthily, as well as keep appearance of the country.

SOUTH YORKSHIRE ARCHITECTS SURVEYORS.

The first of the series of meeting under the auspices of the Sheffield, Yorkshire and District Society of Ar and Surveyors, which took place Sheffield University, was addressed H. Chalton Bradshaw upon "The Ten and Influence of Modern European Ar ture." The lecturer illustrated exam "jazz" and futuristic designs, togeth what he referred to as "Bolshevist" taken from Leningrad and Moscow. T dency in Europe other than this count to try to re-establish architecture in s a shortage of material and a lack of There was not likely to be any national upon English architecture. The City tect, Mr. F. E. P. Edwards, president Society, occupied the chair. Before the ing a collection of R.I.B.A. drawing opened in the Mappin Art Gallery Rowland Matthews.

SOUTH WALES INSTITUTE ARCHITECTS.

Joint Meeting with Builders.

Under the auspices of the South Institute of Architects (Central Branch the Institute of Builders (South Branch), a lecture on "Liverpool Cathe was given at the Engineers' Institute diff, on Thursday, October 20, by Pr C. H. Reilly, M.A., F.R.I.B.A., Mr. Thomas Vice-President R.I.B.A., act chairman. The lecturer stimulated co able interest among a large and repre tive gathering of architects and builde others interested in architecture.

The lecturer dealt ably with bot physical and the spiritual side of th gramme, drawing attention to the spec quirements of the modern cathedral, th ticular case of Liverpool, and the ne for making the structure a symbol of for an enormous community. The s which the cathedral is erected, the tre of the materials of which it is built, a architectural composition were also with in turn.

A vote of thanks to the lecturer wa posed by Mr. J. E. Turner, J.P., F.I and seconded by Mr. T. Alwyn F.R.I.B.A.

Entrance Gate to path leading to St. Crispin's Church, Mashrobra, Simla Hills, India.

Mr. Bernard Matthews, F.R.I.B.A., Architect (*See page* 653).

CORRESPONDENC

[While we are glad to publish letters on pro and other matters of interest to our readers, it understood that we do not necessarily endorse the of correspondents, who will oblige us if they will their views as briefly as possible.]

The Gresham Hotel, Dublin.

Sir,—In your issue of September notice on page 418, column 1, first thre of last paragraph, that the new G Hotel in Dublin "strikes a complete note in Dublin architecture." In th issue, on page 422, under the h "Gresham Hotel, Dublin," lines 8, 9, it is stated that "the hotel façade signed on the lines of the late eigh century Dublin building tradition." Punch would say, "another headache historian."

H. Auberry,
Deputy Principal Arch
Office of Public Works, Dublin.

[The first statement occurs in a sign tribution, and is the personal opinion writer, while the second is made in a tion of the building received from correspondent. We will not attempt to cile two apparently inconsistent stat —Ed.]

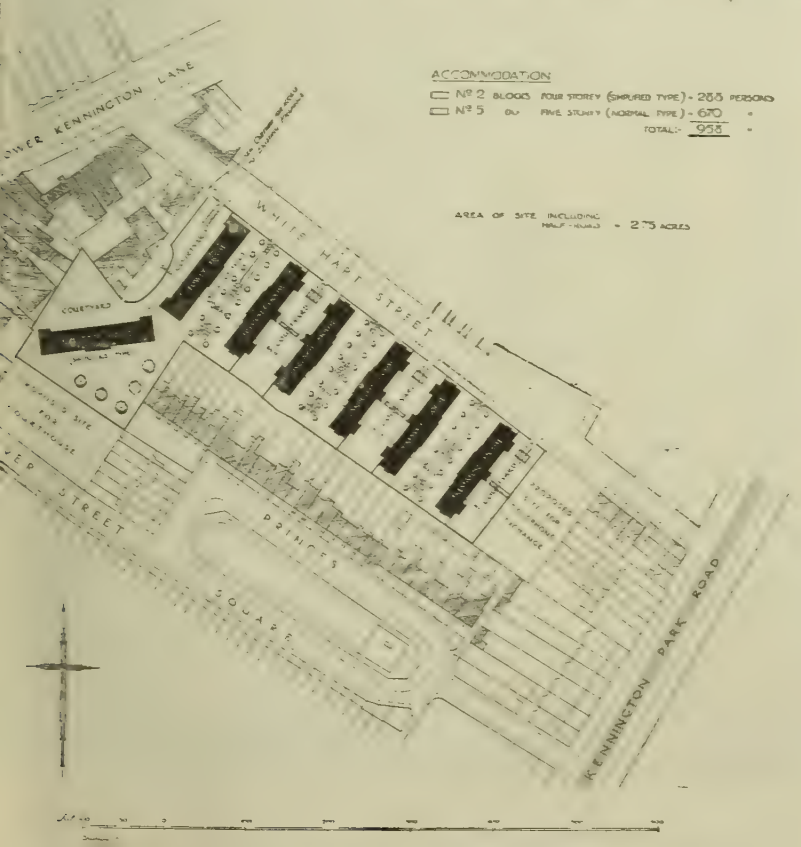
LLUSTRATIONS

Design for Royal Palace, Iraq.

eneral conception of Baghdad, the the Caliphs, the capital of Haroun d, the home of the thousand-and-one s a city of wondrous Eastern palaces lines broken by domes and glittering nestling like gems in gardens of nd pomegranates—at least, such was -war conception. The palms and nates are there, the domes and mina- ak the monotony of the dead-level but the palaces, alas, are absent; h as may, in the long past, have ex- and to-day as neglected and frag- ruins. The only one which retains stiges of its one-time grandeur, that Nasir (A.D. 1180-1225) in the citadel, l as a regimental latrine. With a exceptions, Baghdad is a city of ue hovels.

When His Britannic Majesty's Government decided to grant Arab nationality and a King, it was found that no suitable Royal residence existed in which His Majesty King Feisul could be accommodated. For a short time after His Majesty's arrival he took what cannot be called more than shelter in a portion of the old Turkish Government offices. The scanty foundations of this building were irreparably undermined by the river, and after giving perilously brief warning it completely collapsed into the river. His Majesty very rightly insisted that if he was to rule and administer the country he must do so from a palace more adequately furnished and founded.



A house was secured on the river bank above the city and outside the city's flood protection bunds, and two small royal pavilions were erected in close proximity to it. In these the royal family was scantily accommodated, and in the meantime preliminary steps were taken towards securing a site for a new palace. A suitable one safe from flooding is hard to find in the vicinity of Baghdad, as the Abbassides found one thousand years ago, and the stringent state of the country's finances caused the project to develop very slowly. In 1926 matters had not proceeded farther than vague ideas and rough preliminary sketches. In that year, however, the river burst its retaining banks and flooded the royal residence, causing the royal family to be once again homeless.

A site within the city bunds was considered to be imperative, and it was decided to build the new palace within the area of the old Turkish citadel. This site is on the left bank of the river at the northern end of the town, and is probably the best and most suitable in Baghdad, commanding, as it does, a good view up and down the river where it bends into the town.

The illustration given in this issue shows a preliminary sketch for the palace on this site. It does not represent a complete palace, but rather the first stage which limited finance would permit to be erected at once. In order to secure a commanding position at the bend of the river at the top of the town, the centre portion is brought boldly forward, breaking the frontage in a rather unusual manner.

The plains of Iraq, being deltaic, consist entirely of a river silt, and consequently the only indigenous building material is a very inferior brick of a rather monotonous light yellow colour. In the northern hills round Mosul a certain amount of poor quality stone is found, but the cost of transport prohibits its use in Baghdad. These limitations in choice and quality of building materials impose considerable restriction in design, and when to these is added the very low standard of craftsmanship of the local workmen, these restrictions become most formidable. In Baghdad, it is true, a few craftsmen working in the traditional manner can produce very fine geometrical cut brickwork, but the real understanding of the art is almost entirely absent, and the taste of the workman is inclined towards the most debased and flamboyant designs and their use in the most inappropriate and unconstructional manner.

During his sojourn in Iraq, the author of this design—Mr. J. M. Wilson, A.R.I.B.A.—has endeavoured, while accepting the drawbacks and difficulties imposed by these conditions, to introduce a modern spirit in the architecture; not, however, by imposing western styles or motifs, but by marrying the best of local art and craftsmanship with modern building methods and design. The result might be termed modern Saracenic.

Lay-out Plan, L.C.C. Kennington Housing Site, Lambeth.

Mr. G. Topham Forrest, F.R.I.B.A., Architect to the L.C.C.

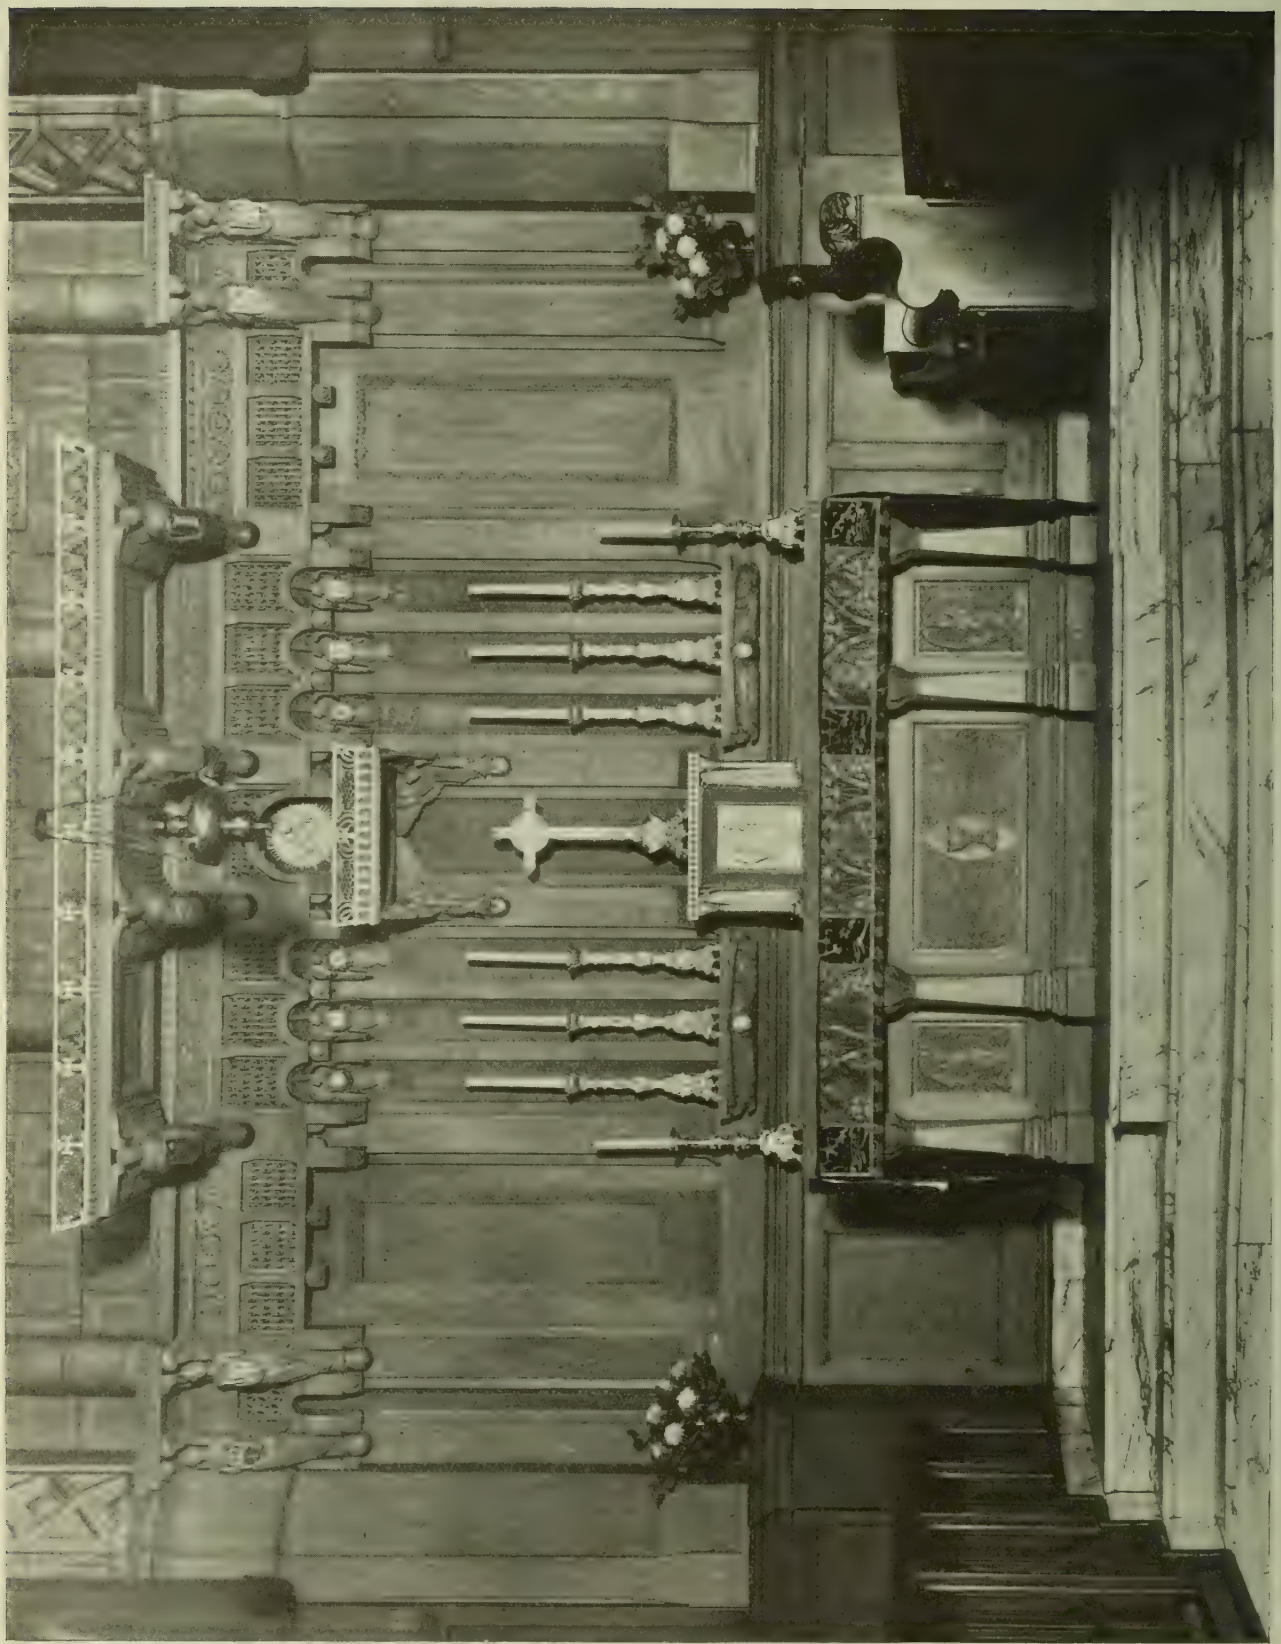
Kennings Estate (White Hart-street Site), Kennington.

This estate is being developed to provide accommodation in connection with the rehousing of the persons to be displaced from the China Walk Area, Lambeth. The site is about 2.3 acres in extent and forms part of the estate of the Duchy of Cornwall. The Duchy, being unable to dispose of the freehold of the property, have granted the Council a lease for a term of 120 years, the rent to be a peppercorn for the first ten years, £650 a year for the next fifty years and £1,300 a year for the remaining sixty years.

The approved scheme of development consists of the provision of accommodation for 958 persons in 169 tenements in two blocks of dwellings of a simplified type of accommodation and five of the normal self-contained type of accommodation. The names selected for the several blocks of dwellings are those of manors and estates of the Duchy of Cornwall, in view of the site being part of the estate of the Duchy.

Blocks 1 and 2, Calstock and Fowey Houses, which are of the simplified type, contain 16 tenements of one habitable room, 16 of two rooms and 32 of three rooms, with a rehousing capacity of 288. They were commenced in September, 1926, and completed by August, 1927, the contractor being Mr. R. J. Rowley, and the amount of the accepted tender £21,684, or £150 per room. Blocks 3 to 7, Helston, Liskeard, Landulph, Penmayne and Trematon Houses, will consist of the normal type of accommodation and will contain 15 tenements of two habitable rooms, 60 of three rooms, 25 of four rooms, and 5 of five rooms, with a rehousing capacity of 670. They were commenced in February, 1927, and are due to be completed in January, 1929, the contractor being Mr. R. J. Rowley, and the amount of the accepted tender £53,027, or £158 per room.

The scheme has been designed by Mr. G. Topham Forrest, F.R.I.B.A., Architect to the Council.



The following sub-contractors were engaged on the work:—Limmer and Trinidad Lake Asphalte Co., Ltd., and Permanite, Ltd., asphalt; E. Parkinson (London), Ltd., and Roberts, Adlard and Co., roof tiling; Clark, Hunt and Co., Ltd., wrought-iron work; Albion Iron and Wirework Co., Ltd., rainwater goods, soil and waste pipes; Carron Co., stoves; Nettlefold and Sons, Ltd., ironmongery; A. C. W. Hobman and Co., tar paving.

[Other descriptions are given on pages 662, 663, and 665.]

SECONDARY SCHOOLS—II

By T. P. BENNETT, F.R.I.B.A.

(*Continud from page* 626.)

Art Rooms.

Art rooms need north lighting and an area 30 sq. ft. per pupil, and there should be parate rooms for elementary and advanced ork. Alternatively, it is of great assistance have one room devoted to object or model rawing with pupils seated in the form of a mi-circle, and another room for design, etc., here the students can be seated at desks. sink is required, and water should be laid a.

The Board of Education allows the assembly all to be used as an art room, but this rrangement is unsatisfactory from the point f view of drawing.

Artificial lighting is preferable by means of ne powerful point lamp for the " light and hade " studio.

Housecraft Rooms.

Recent girls' schools have included substantial accommodation for housecraft, and in his connection rooms used for housewifery, ooking, and laundry must have 30 sq. ft. of lear floor space per student, with an allowance of 5 sq. ft. per head for fixed apparatus. Accommodation should be provided for not nore than fifteen to twenty pupils in one lass. North light is desirable. Cookery and aundry rooms should be placed in a position vhich will avoid unpleasant smells entering he remainder of the school buildings. Gas nd coal cooking ranges, and where possible lectric cookers, should be installed. There nust be more than one sink and draining oard, and ample bench room. Benches should be about 6 ft. by 2 ft. 6 in. by 2 ft. 6 in. high.

In America some recent schools have been equipped with a gas range for each student. This is highly desirable, as it is the only method of giving pupils individual tuition. Up to the present it has not been possible to do this in England on account of the cost. Ample storage space is necessary. The gas supply should be controlled from the teacher's desk by a stopcock.

Handicraft Rooms.

Handicraft rooms are required in all schools for boys of more than twenty pupils, and 30 sq. ft. of floor space are necessary per head and 4-ft. gangways between the benches. These classrooms should be modelled on a workshop rather than a schoolroom, and a flat ceiling is not necessary. They should have a wood-block floor and tool-racks for each bench. A useful size for benches and their arrangement is shown on Fig. 5.

Preparatory and Kindergarten.

Special provision is required in these rooms with regard to aspect (S. or S.E.), light, and ventilation. They must have easy access to the open air, fireplaces, and wall-blackboards for the use of the children. They should have separate accommodation for lavatories and cloakrooms. Recently efforts have been made to plan some of these schools so that an entire side is removable by means of sliding partitions, thereby giving practically open-air teaching. In one such school designed by Mr. Geo. H. Widdows heating was by means of hot air in hollow blocks under the floor covering, and was said to be satisfactory.

Staff Rooms.

A room for the headmaster is required near the main entrance, with separate lavatory and w.c. accommodation, and a waiting-room is desirable. In mixed schools a separate room is required for the senior mistress. Separate rooms are necessary for assistant masters and mistresses, with special lavatory and w.c. accommodation, and they should be so planned that they overlook the playgrounds.

Stores and Service Rooms.

Special storage space is required for stationery, books, games, etc., and a room should also be provided for storing the utensils used by the school cleaners.

Dining Halls.

Two feet run of space at the table is needed per pupil and 10 sq. ft. of floor area, and there should be ample kitchen and larder accommodation adjoining. Tables should be 2 ft. 8 in. wide, the space for sitting should be 1 ft. 4 in. deep, and the distance back to back of chairs should be 2 ft. 6 in., or from the back of the chair to the face of the wall, 3 ft. (See Fig. 6.)

Library.

A library and common room are desirable.

Music Rooms.

Practice rooms should be 8 ft. by 8 ft. 6 in., with soundproof partitions and doors, and as isolated as possible. In girls' schools it is usual to provide two of these for every 100 students.

Gymnasium.

The size of the gymnasium should not be less than 50 ft. by 25 ft., but is better 60 ft. by 30 ft. It should have a flat ceiling 16 ft. high above the floor, and a continuous range of windows down each side, the underside of the sills being 9 ft. up from the floor, with the sashes hung on centres. At least one end-wall should be left blank, and there must be a lobby and changing-room attached. The most satisfactory type of flooring is found to be narrow boards on joists.

Cloakrooms.

Separate cloakrooms are necessary for each sex. They should be as near to the entrances as possible and also near the pupils' offices, and must be entered from lobbies or corridors. They require to be heated and well ventilated. Good lighting is essential. The floors should be of asphalt or other impervious material, with a dado about 5 ft. high of glazed tiles.

Pegs for boys' clothes should be 10 in. apart in one horizontal row, and for girls' 15 in. apart, with seats and boot racks. A space of 5 ft. is required between the stands for both girls and boys. Changing-rooms for the gymnasium must be fitted with foot and spray baths.

In America discussion is still proceeding as to the relative advantages of putting cloaks in separate cloak-lobbies attached to each classroom or in one large cloakroom for each sex. In England the practice of putting cloaks in classrooms is uniformly condemned. The spacing for pegs in America is 12 in. on centres in two rows placed zigzag.

Lavatories and W.C.'s.

Lavatories must be provided in the following proportion:—

Boys.—One basin for every 20 boys up to 100; one basin for each succeeding 25; 18 in. allowed per basin.

Girls.—One basin for every 10 girls up to 100; one basin for each succeeding 20; 18 in. allowed per basin.

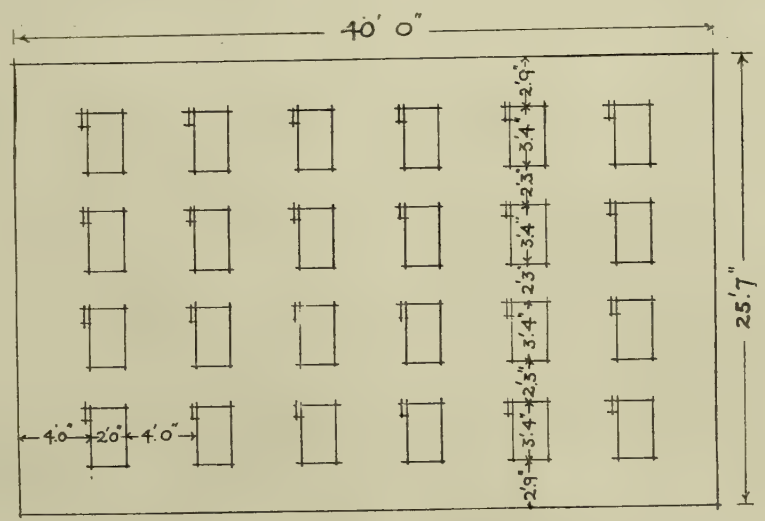
A lock-up slop sink and basin should be provided for the use of the caretaker.

Closets are required as follows:—

Boys.—One closet for every 25 boys. These must be disconnected from the main building.

Girls.—One closet for every 15 girls up to 100; one closet for each succeeding 20. These should be in the main building, but suitably isolated or approached by a covered corridor.

Urinals for boys should be in the following proportion:—One for every 15 up to 100, and one for each succeeding 20.



Generally, closets should be not wider than 3 ft. nor less than 2 ft. 3 in., each lighted and ventilated, and having a door which should be 3 in. short at the bottom and 6 in. short at the top. Partitions are best when carried up for 6 ft. only, and should be constructed of a hard smooth material on which writing is impossible. Each w.c. must have a separate flushing cistern.

The experiment has been tried of erecting a plumbing space in the offices in which the flushing tanks and the whole of the waste and flushing pipes are placed; the space then being specially heated as a protection against frost. This has proved satisfactory.

Lighting and Ventilating.

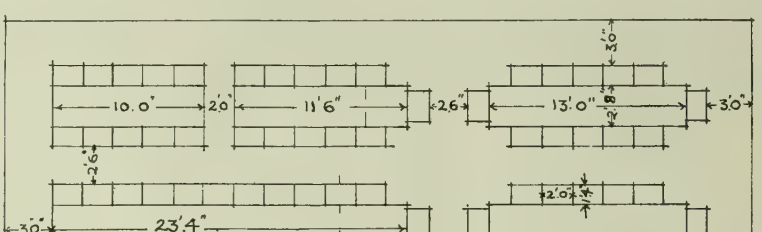
Increasing attention must be paid to lighting and ventilation, and in this connection prominence is given to " through ventilation," which is obtained by having windows open to the air on opposite sides of every classroom. Special attention should also be paid to the angle of light which enters every room and the position of the pupils' desks. Information on this subject is given in the paper read by Mr. Geo. H. Widdows before the R.I.B.A., and quoted in last week's article.

In America uni-lateral lighting is considered highly desirable. The area of the glass must equal one-fourth of the floor area and 40 to 50 per cent. of the total area of wall-space on one long side of the room. Windows must extend from 3 ft. to 3 ft. 6 in. above the floor to within 6 in. of the ceiling.

HANDICRAFT WORKSHOP FOR 24 STUDENTS.

FIGURE 5.

Thirty cubic feet of air is the minimum allowed per pupil.



Projecting beams or girders in the ceilings of rooms considerably hinder ventilation.

Experiments on the amount of light reflected from various substances have given the following results:—

Colour or material.	Amount of light reflected. Per cent.
Yellow	40
Blue	25
Dark brown	13
Deep chocolate	4
Plain deal, clean	40–50
Plain deal, dirty	20

Heating.

The temperature should be even and moderate; in England, 60° F. where windows occur on both sides of the classroom; in America, 70° F. For each 1,000 c. ft. of the contents of the room, 25 to 30 sq. ft. of heating surface is necessary. High-pressure steam and hot water are not approved, and slow-combustion stoves are undesirable. In England a system of low-pressure hot water is generally most satisfactory, and in this case 18 sq. ft. of heating surface is necessary for each 1,000 c. ft. of air, with variation according to aspect. 160° F. in the boiler will give about 145° F. in the radiators. Radiators should be carried on brackets to allow the floors to be thoroughly swept, and should have an air-inlet behind each having at least 72 sq. in. opening in the clear. Other systems of heating were mentioned by Mr. Geo. H. Widdows in the paper read before the R.I.B.A. quoted at the head of last week's article.

DINING ROOM
SHEWING VARIOUS ARRANGEMENTS.

FIGURE 6.

Construction.

Solid construction is asked for: 13½ in. if in brick and 20 in. if in stone, with the usual by-law provisions for damp-proof course, solid floors, etc. Latterly, however, there has been a tendency to employ semi-permanent construction on account of the changing conditions of school planning. The drawback to the use of such buildings is that their cost in many cases approaches that of a more permanent building, and experience proves that when a building is once erected the initial cost proves too high to allow it to be pulled down and re-erected with each phase in the development of knowledge or change of fashion. Similar comments apply with greater force to buildings of a temporary character, and practically speaking, therefore, permanent buildings are desirable.

It is now recognised that the appearance of the building has considerable effect on the scholars and teachers, and therefore sound proportions, attractive elevations, and pleasing colour both inside and out should be aimed at. Each building should have a distinctive character, so that it inspires *esprit de corps* and enters into the lives of children as far as possible. Local tradition should also be studied in connection with the decoration of a building, and the children encouraged to study the history of the locality in which they were born.

(To be concluded.)

GROSVENOR HALL RE-BUILDING, BELFAST

This building, which we illustrate in this issue, is of steel frame construction built on reinforced concrete foundations supported on piles. The external and internal walls are of brick and the floors of reinforced concrete, thus making the whole fabric fireproof. Portland stone facings are employed at the main entrance from Grosvenor-road to the large hall, and also at the two flanking entrances on the Grosvenor-road, and to the main entrance in Glengall-street.

The large hall, which seats 1,800 people, excluding the platform space, is planned midway between Grosvenor-road and Glengall-street, so as to be removed from the noise of the streets, and is fan-shaped. At the platform end the hall measures 47 ft. across, gradually widening to 105 ft. at the centre, from which point the side walls run parallel. The galleries at side and back are supported on cantilever beams, the only column supports employed being at the back gallery, and these being near the back of the seating area cause no obstruction of view.

The roof of the large hall is supported by ten steel principals, those over the widest part having a span of 105 ft. and each weighing seven tons. The ceiling of the hall is suspended from the principals by steel hangers, the widest span being slightly arched, the remaining tapering portion being divided into a series of panels, which contain ceiling lights, light being admitted into the roof area by four rows of patent glazing along the whole length of the roof. The steelwork structure of the building is reflected in the interior design of the hall in the wall pilasters and ribbed ceiling, which are in fibrous plaster. A cinematograph operator's room is provided for, with its necessary modern equipment, and the screen when lowered in front of the organ will be visible from every seat in the hall.

The heating is by means of a low-pressure hot water system of pipes and radiators, the system in the large hall being entirely separate from that in the minor hall, offices and classrooms, so that the heating of the whole building can be effected with the greatest economy. The firing is by means of oil fuel on the "Rotamisor" system. The ventilation of the hall is augmented by mechanical extraction.

The hall is lighted by ten semi-circular headed windows over the galleries, two circular lights in the hall over the platform and by ample lights in the ceiling, giving on to the roof space and by lights at the back of the hall over the gallery. Artificial illumination is provided by twelve domed lights with reflectors recessed in the ceiling and by a series of wall bracket lights and by ceiling lights under the galleries.

Generally, the hall is planned to seat 960 in the auditorium and 850 in the galleries and orchestra, which are connected. The seating in the auditorium is arranged segmentally, as the shape of the hall demands, and the seats are tip-up theatre pattern. The organ from the old hall has been rebuilt in the recess provided for same at the platform by Messrs. Hill, Norman and Beard, Lond The platform front is of polished o which with the bronze rail is gift of the staff and present former pupils of Methodist College, Belf who also gave the bronze memorial pla with bas relief head, by Miss S. R. Prae Holywood, Co. Down, in memory of the R R. M. Ker. Miss Praegar also modelled bas relief head of the founder of the miss R. Crawford Johnson, D.D. The platfo furniture was made to design by Messrs. J. Mayrs and Co., Ltd., Belfast, and is the of a friend of the mission.

The minor hall, approached from Gleng street, with seating accommodation for to 600 children, is 70 ft. long by 32 ft. 6 wide. This hall is on the ground floor has a gallery at the platform end for ch use and two small galleries at the back. ministration office accommodation is also p vided in the Glengall-street building. kitchen is arranged so that it is conveni both to the minor and large halls, as a are the vestry and retiring room.

The main entrance in the Grosvenor-road flanked by four shops, two on either si The first floor above the shops is approach from landings on main stairs to the gall and from one of the side entrances on Gr venor-road. The three floors above when co pleted will be suitable for office use, divi with a central corridor with suites of offi on either side.

The architects were Messrs. Young Mackenzie, of Belfast, the surveyors Mess W. H. Stephens and Sons, of Belfast, the consulting electrical engineer Mr. Pleasance, M.I.E.E., of Belfast.

The general contractors were Mess McLaughlin and Harvey, Ltd., Castle Building Works, Belfast, and the sub-co tractors were as follows:—Musgrave and C Ltd., Belfast, heating, steelwork, ventilat and ornamental ironwork; Wm. Curran Son, Belfast, plumbing and electrical wo W. W. Turner and Co., Ltd., Birmingha seating; W. D. Henderson and Sons, Belfa tiling; A. Malcolm and Co., Ltd., Dubl fibrous plaster work; The Pyrene Co., Lt Belfast, fire extinguishers; The Rockw Flooring Co., Manchester, Terrazzo dado Toffolo Jackson and Co., Glasgow, Terra flooring; The Birmingham Guild, Ltd., bro plaques; E. T. Thompson and Sons, Belfa carving; J. McKelvey, Belfast, lettering; Limmer and Trinidad Lake Asphalt C Ltd., London, asphalt work; W. H. K and Co., Larne, gutters to main roof; Ridd Ltd., Belfast, collapsible gates; W. H. H wood and Co., Huddersfield, patent glazi W. F. Clokey and Co., King-street, Belf glazing.

ST. CRISPIN'S CHURCH SIMLA HILLS, INDIA

St. Crispin's Church, of which we give il trations this week, is situated in Ma bra, a village about six miles from Sir the summer headquarters of the Governm of India. The church occupies a pictures site on the summit of a small knoll o looking the village and is unique by rea of its situation at an altitude of 8,000 As to the materials used in its construct the stones were quarried either on the or in its vicinity, with the exception of fine variety required for window dress and tracery, which was obtained from Ka 6,000 ft. below, at the foot of the h conveyed by rail to Simla, and thence to site by mule transport. The woodwor from timber obtained from trees felled on site.

The effect of the main design has b heightened by windows which have been f with stained glass (to Mr. Grylls's desi depicting the saints:—St. Oswald, St. M tin, St. George, St. Michael, St. Gabriel St. Crispin. The east window is resplen with colours illustrative of a free treatm of the Resurrection.

The history of the execution of the b

g has also an interest of its own, the work ving been entrusted to a Sikh contractor d carried out by him, with the assistance illiterate hill workmen, who had never seen drawing or worked upon a similar structure reviously. Consequently all the details had be drawn full size and their complete gnificance explained in the Hindustani lan- iage. The church is complete in every de- il, the organ and tubular bells having been ecially designed and imported from Eng- nd. A lychgate has been constructed at e entrance to the grounds on the main road, om which a winding path leads up to the urch.

The architect of the work was Mr. Bernard atthews, F.R.I.B.A., Calcutta, India.

EW CHANCEL TO FORTY HILL CHURCH, ENFIELD

This chancel, which we illustrate on ge 652, has been designed by Mr. E. Henderson, F.S.A., L.R.I.B.A., archi- ct to the Faith Craft Studio, Ltd., for e vicar, the Rev. Canon Carr Smith, under bequest by the late Sir Henry C. Bowles, L. The whole of the work has been car- ed out in fire-resisting materials. The ass of the old three-light window has been used in the new side windows under the pervision of the Faith Craft Studio. The ass to the new east window was a gift om Sir Henry Bowles, Bart., his family and other, Mr. E. A. Bowles, and was designed d executed by Mr. Percy Bacon.

The brickwork is of good picked stocks and e stonework was by Messrs. Emerson and orris, of Brentwood, and carried out in their cast stone." By this process a great saving s been effected, for there is no stone waste d all mason work to elaborate tracery has en avoided.

The old east wall was taken down and a chan- l arch inserted. Above this a steel joist was serted extending from turret to turret and eel ridge purlins and plates were suspended om it. These extend to the new east wall, that no thrust is given by the reinforced ncrete roof, which is simply coffered on the terior. The plates stand forward from the all and are further strengthened by "cast one" angel brackets. The steelwork was Messrs. Douglas Young, of Queen Anne's- te, and the angel brackets modelled by r. C. Jewitt, of Muswell Hill, in such a ay that each angel was cast in one solid ece 4 ft. high and 12 in. wide.

The general contractors were Messrs. J. am and Son, Eastbrook, Waltham Abbey, d the whole work was carried out for the nall sum of £2,050 (not including the w east window). The interior is of a simple aracter, as the intention is to paint and corate it when funds permit.

R.I B A. ARCHIBALD DAWNAY SCHOLARSHIPS

The R.I.B.A. Archibald Dawnay Scholar- ips are offered annually by the Royal stitute of British Architects for compe- ion between students of recognised schools, d are intended to foster the advanced udy of all forms of construction, the onomic and practical use of materials, and e logical expression in architectural sign of structural elements. This year, r the third time in succession, the 75 scholarship has been awarded to a udent of the Architectural Association, r. G. R. Beveridge being the winner. This a testimony to the high standard that is ing attained in the school in the study d delineation of construction and actical detail.

Our illustrations (pp. 658-660) show ex- mples of the work of Mr. G. R. Beveridge, e subject being working drawings which rm part of the general school course.

THE INCORPORATED ASSOCIATION OF ARCHITECTS & SURVEYORS

OPENING OF NEW INSTITUTE PREMISES AND ANNUAL DINNER.

The new premises of the Incorporated Association of Architects and Surveyors were opened formally on Saturday last by Mrs. W. Forbes Campbell—wife of the President of the Association. These premises are at 1, Wilbraham-place, Sloane-street, S.W.1, and are fitted in every way for the purposes of the Association. The façade is very quiet and dignified, and the stone mullioned windows add to the pleasing effect. The interior is entirely adequate for its purpose, and comprises on the ground floor a general office and the members' room and library, the council chamber being on the first floor, as also the Secretary's office. A feature of the Institute is the provision of a number of small rooms which members may reserve for the purpose of interviewing clients. These rooms are on the upper floors, while in the basement are extra clerical offices and a strong-room.

After Mrs. Campbell had opened the building with a silver key, a tour of inspection was made of the premises, and later Mr. R. S. Gledhill—the senior Vice-President—proposed a vote of thanks to Mrs. Campbell for her kind offices.

The President replied.

Annual Dinner.

Mr. W. Forbes Campbell (President) occupied the chair at the annual dinner, held at the Hotel Cecil on Saturday last, following the annual general meeting of the body. Nearly 300 members and guests were present.

Mr. W. W. Henderson proposed the toast of "The Association." After referring to the work of the officers of the Association during the past two years, he said the objects of the body, which were mainly the fostering of educational aims and aspirations, and seeking to maintain the highest traditions of the professions, and to induce new life into them, were worthy not only of the commendation of the members but also of their active support. It was not sufficient for the officers of the Association to devote their time and energies in its interests; if they were to succeed they must also be able to count on the active co-operation of all the members.

The President, in responding, said he had no hesitation in saying that for an Association of its kind they had created a record. At the time of the last annual dinner they had about 500 members; to-day they had 1,200, and many others were waiting for their applications to be dealt with by the Applications Board. In the early days of the formation of the Association they never in their fondest dreams expected that their efforts would be crowned with such success. They had endeavoured to do something for the professions to which they belonged. Their whole policy was honesty of purpose, progressive methods, endeavouring to benefit by the flaws in some of the older institutions. Why should not they, as architects, surveyors, engineers, and the building trade, progress to the extent to which many other professions and industries had developed? He thought the professions and the industry in which they were concerned could undoubtedly develop by paying strict attention to, for example, education, by avoiding the cramming system, which did not tend towards efficiency but rather the reverse. Those coming into the professions should not have to go through the same processes of education that those present had undergone. Let them try to get a system of progressive education throughout; for example, articled pupilage. If young men were not strong in particular subjects they should not be condemned but rather helped in those particular subjects. The Association was a young one, with a definite object in view, namely, to benefit from the experience of the older bodies. They wanted to try to be modern. They wanted to try to be something real. They wanted to assist their members in their various professional difficulties.

"The Other Professional Institutions" was proposed by Mr. C. H. Taylor, and responded to by Mr. H. J. Deane (President of the Institution of Structural Engineers), Mr. A. Dryland (Vice-President of the Institution of Municipal and County Engineers), Mr. D. C. Fidler (President of the Society of Engineers), and Mr. Samuel Wallrock (President of the Inc. Society of Auctioneers and Landed Property Agents).

Mr. Taylor said it was perhaps natural that the older societies should have regarded their Association with a little prejudice. But he thought by their conduct and demeanour they had shown their seniors that they had a real desire to do the right thing, and he was sure he was voicing the views of the members when he said that their aim was to bring about a close co-operation with their sister institutions; they would always welcome their suggestions and views derived from long and successful experience in the conduct of their organisations. It was only a little over two years since the Association was born, but its growth had been phenomenal. Professional men with many years of business experience had joined their ranks and assisted with their advice.

Mr. Deane said the question of education was one of the most important problems of any association, because unless there were proper qualifications they were liable to get members who were not worthy of the traditions of the body.

Mr. Dryland said he welcomed new associations because the old ones were liable to get a little moth-eaten, and the starting of new bodies would be a great spur to them. A few years ago a rival institution was started for municipal and county engineers. That acted as a great spur to the Institution he represented, and finally they swallowed it.

Mr. Wallrock said his Society came into being for exactly the same reason as the Association of Architects and Surveyors. The result was that those who had never joined any society—because they considered their reputations sufficient protection and needed no society to look after their interests—banded themselves together in order to teach the older societies that they had no monopoly of those things. He thought by now the older bodies had learnt to toe the line. The Association was recently in the same position, and his Society decided to give them all the assistance they could. The Architects' Registration Bill looked like putting the members of the Association out of business, and his Society was prepared to attack it. His Society had sent a letter to the Press stating its intention of attacking the Bill, and that brought a letter from the older institution saying that they thoroughly recognised his Society and were prepared to give it a seat on the Registration Board. But his Society refused to accept the offer, and had decided to stand by the Association because they believed that everybody ought to be able to earn his living without being registered by anybody.

The toast of "Our Guests" was proposed by Mr. R. I. Tasker, M.P., and responded to by Mr. G. M. Garro-Jones, M.P.

An Antiquary's Estate.

Alderman Edward Wooler, F.S.A., of Danesmoor, Carmel-road, Darlington, who died on July 7, aged 76, left unsettled property of the gross value of £58,452, with net personalty £16,508.

Joseph Conrad Memorial.

A memorial panel in the porch of the village hall at Bishopsbourne, near Canterbury, erected by friends and admirers throughout the world as a tribute to Joseph Conrad, has been unveiled by Mr. R. B. Cunninghame-Graham.

LEGAL SECTION

NOTES ON CURRENT CASES

The Rent Restriction Act, 1923.—Decontrol.

THE case of Oakley *v.* Wilson, heard in May last, and upon which we gave a short note in our issue for June 3, based upon a brief report in the *Times*, is now reported in the Law Reports, 1927, 2 K.B. 279, and requires further notice than we were able to give it.

The defendant in the action had for some 18 years been the tenant of a cottage under a quarterly tenancy at a rental of £2 12s. a quarter, she paying the rates and taxes. At some date, not stated in the report, she had sub-let this cottage to one Riordan, who was in occupation at the latter part of 1925, but died on December 4, 1925. The defendant had then taken possession of the cottage and had it cleaned out, and after an interval of about ten days sub-let it to the plaintiff in this action on a weekly tenancy.

In August, 1926, some differences arose between the defendant and her sub-tenant, and she gave him notice to quit, and on October 19, 1926, a notice was served upon which a warrant for possession had been granted by the Justices under the Small Dwellings (Tenements Recovery) Act, 1838.

In December, 1926, the plaintiff brought this action in the County Court under section 3 of that Act for trespass, alleging that the defendant had not, when the warrant was granted, lawful right to the possession of the premises. This raised the question whether, in the above circumstances, the cottage had become de-controlled from the Rent Acts by virtue of section 2, subsection (1), of the Rent Act, 1923. The County Court judge had held that the defendant was the "landlord" of the premises and had come into possession under the above subsection, and therefore the action must be dismissed, but he only came to that conclusion on account of the decisions given upon the subsection, and the plaintiff appealed to a Divisional Court.

This raised the question whether a quarterly tenant such as the defendant here was, who sub-let on a weekly tenancy, could be deemed to be "the landlord" within the meaning of Section 2, subsection (1), of the Rent Act, 1923, but in argument it was not conceded that any lessee, however long the term of years might be under which he held, could be "the landlord" within the section.

The Divisional Court examined passages in the Rent Acts where these words are used, in order to ascertain the meaning to be attached to the words, being of the opinion that the same meaning should be given to the words, wherever used, unless the context otherwise indicated, and came to the conclusion that their meaning could not be limited to indicating "the owner," "freeholder," or "head landlord," and that there was nothing in the authorities, which the County Court judge had carefully and accurately reviewed, to conflict with the decision at which he had arrived, that the defendant in this case was "the landlord" within the meaning of section 2, subsection (1), of the Rent Act, 1923, and the cottage was de-controlled. Those authorities were Dunbar *v.* Smith (1926, 1 K.B. 360; *The Builder*, December 25, 1925); Catto *v.* Curry (1926, 1 K.B. 460; *The Builder*, March 12, 1926); and Doulin *v.* Parcell (1926, 43 T.L.R. 140; *The Builder*, December 31, 1926). This section has been the cause of much doubt and litigation, owing to the unsatisfactory form in which it is drafted. This case was decided under the first portion of the section, but there are two provisos to it.

The section (section 2, subsection (1)), reads: "Where the landlord of a dwelling-house to which the principal Act applies is in possession of the whole of the dwelling-house at the passing of this Act, or comes into possession of the whole of the dwelling-house at any time after the passing of this Act, then from and after the passing of this Act, or from and after the date when the landlord subsequently comes into possession, as the case may be, the principal Act shall cease to apply to the dwelling-house; . . ."

Dunbar *v.* Smith and this case fell within this part of the section, and show that where a tenant has sub-let a house which is a dwelling-house within the Rent Acts, and then comes into possession of that dwelling-house as a whole, meaning by this not the structure as a whole but the technical dwelling-house as created by the Rent Acts, then the dwelling-house is de-controlled.

Dunbar *v.* Smith explains this technical interpretation of the Acts. In that case a dwelling-house had been let in separate floors since before the Acts came into operation. In November, 1923, one of these floors had become vacant, and the landlord had taken possession, and at the end of 14 days had re-let it to another tenant. The County Court judge had held that the landlord must come into possession of the whole house as a structure, but the Court of Appeal held that he had obtained possession of that entity created by the Rent Acts, "a dwelling-house to which the principal Act applies," and therefore the floor had become de-controlled. It should be mentioned that in Dunbar *v.* Smith, on appeal to the Divisional Court, it was suggested that the person who was treated as "the landlord" was in reality a tenant, but the Court of Appeal declined to consider this point, as it had not been taken before the County Court judge, and the person was treated by the Court as a freeholder. Thus Oakley *v.* Wilson now supplies the missing link in that case, and decides that for this portion of the section a "tenant" who has sub-let the whole premises is "the landlord."

The difficulties experienced have chiefly centred on the first proviso to this subsection, which is as follows:—"Provided that where part of a dwelling-house to which the principal Act applies is lawfully sub-let, and the part so sublet is also a dwelling-house to which the principal Act applies, the principal Act shall not cease to apply to the part so sub-let by reason of the tenant being in or coming into possession of that part, and if the landlord is in, or comes into possession of any part not so sub-let, the principal Act shall cease to apply to that part, notwithstanding that a sub-tenant continues in, or retains possession of any other part by virtue of the principal Acts." It was pointed out by a Divisional Court in Catto *v.* Curry (*ubi sup.*) that this proviso contemplates three parties, and not only landlord and tenant; that is to say, the landlord, his tenant, called the mesne tenant, and the sub-tenant of the latter. In this case the mesne tenant (the nature of his tenancy was not stated), before the passing of the Rent Act, 1923, had sub-let two rooms on the ground floor and a bedroom on the first floor to a sub-tenant, who gave up possession after that Act came into force. The mesne tenant had entered into possession and had carried out certain repairs, and ten days later had re-let the rooms to another sub-tenant, which, it was admitted, constituted "a dwelling-house to which the principal Act applied." It was held that by reason of the proviso the de-control given by the first portion of the section does not apply to a mesne tenant who has come into possession of that part of the house sub-let by him, the reason for this being that it would lead to injustice, as control would continue between the landlord and his immediate tenant, but that tenant would become free from restriction as regards his sub-tenant.

The case of Doulin *v.* Parcell, being unreported in the Law Reports, is somewhat difficult of accurate explanation. It appears that the person there claiming de-control was a lessee under a lease for three years, dated November 24, 1922, and he had, in November, 1924, *i.e.*, after the Act of 1923, had come into force, sub-let four rooms, and in 1925, he had purchased the freehold, h tenant still being in possession of th sub-let. He claimed de-control, but a sional Court held that, the sub-tenancy in existence, the house was not de-cont This case can perhaps be explained lows:—At the time the sub-tenancy of the premises was created, the person ing that sub-tenancy was a mesne therefore, if he came into possession he purchased he would be within th part of the proviso, and as a mesne his occupation did not make the princi cease to apply; whereas (as the fact her by the time he became owner then the house was sub-let and the latter the proviso applied, "and if the land in or comes into possession of any part sub-let the principal Act shall cease to to that part, notwithstanding that tenant continues in or retains posses any other part by virtue of the pr Act."

A still more difficult case is Cohen (1927, 1 K.B. 865, *The Builder*, Decem 1926). The plaintiff in that case by ment made in June, 1913, became the of a lease made in 1871 for a term years which therefore would expire i In 1922 he had let the top floor to fendant, but with the exception of th he had been in possession of the whol until 1925, when he let three rooms ground floor to the defendant. It w mitted that these rooms constitu separate dwelling-house for the purp the principal Act. The plaintiff had the defendant notice to quit these rooms, but the defendant set up th Acts. We find the report very diffi follow as the position as regards the let on the top floor is not made cle we can only quote the material passag the judgment: "The top floor of th house was let by the plaintiff to the dant in 1922, but the plaintiff and his occupied and lived in the rest of th until 1925, when he let rooms on the floor as a separate dwelling-house to fendant. It has been argued that plaintiff, the present landlord of th rooms, was in personal occupation whole house, including these three ro the time of the passing of the Act, rely upon Section 2, subsection (1). W plaintiff was in actual occupation o three rooms they did not constitute ing-house but only part of one and t let separately, so that the relation landlord and tenant did not exist in of them. . . . The real question is the physical occupation of the house included these three rooms, was posse the dwelling-house constituted by the rooms within Section 2, subsection (1 Act of 1923. The Act does not app case where possession by the person now in fact the landlord was not po at the material time of a dwelling-h separately, nor was possession by a la and therefore there was no possessio whole of the dwelling-house, that is passing of the Act of 1923. . . . The tion between Dunbar *v.* Smith and t is that there the landlord, after the of the Act of 1923, came into posse what was already a dwelling-house wi Rent Restriction Acts, and a dwelli of which he was already landlord came into possession."

As this case is reported we find obscure, but the decision is reconcila other cases if at no time the plaintif possession of the whole house, that i letting of the upper floor continued taken into consideration, but the le that floor is not even mentioned in t note to the case. From the first quoted above from the judgment, hov appears that at the time when the 1923 came into force and at the tim letting to the defendant of the grou the plaintiff had never been in posse the whole house, and this would b decision into line with other cases.

HE LONDON BUILDING ACTS AND THEIR APPLICATION—XXXII

By H. V. MILNES EMERSON, A.R.I.B.A.

LEGAL PROCEEDINGS—(*Continued*).

IMES a difficulty arises in fixing the me when the matter of a complaint mation is received. It has been held a building erected beyond the general frontage without the consent of the the matter of the complaint arose as the erection of the building had beyond the general line of frontage, at the six months' limit under the ry Jurisdiction Acts commenced to soon as the building was so far as to show that it would project be- ne line of frontage. In cases where y is provided for the continuance of nce, proceedings can be commenced at e, and such proceedings can be com- against a person who in the first did not commit the offence but con- he offence, provided that such pro- s were taken in respect of the original within the six months. (London Council *v.* Cross, 66 L.T. 731; olitan Board of Works *v.* Anthony, M.C. 39; London County Council *v.* 63 L.J.M.C. 218.)

ollowing decisions have been given:—

Appeals.

ime limitation commences to run from piration of the time during which may be exercised, where the right of rom an apportionment has been given. *v.* Dodgson, 32 L.J.M.C. 113.)

provisions for appeal from a decision etty Sessional Court are as follows: party to the proceedings, if dissatis- h the decision of the Petty Sessional or who desires to question a convic- ler or determination of such Court on und that it is erroneous in point of is in excess of jurisdiction, can under 33 of the Summary Jurisdiction Act, pply to the Court to state a special tting forth the facts of the case and unds on which the proceeding is ques- and, if the Court decline to state a ay apply to the High Court of Jus- an order requiring the case to be

e any matter under Section 120 comes a Superior Court, no appeal will lie he decision of the Superior Court is empowered to exercise such power igating or remitting the penalty im- by the inferior Court or to make such s the Court shall deem fit. (Payne *v.* , 66 L.T. 148 (1892).)

ry of Expenses Incurred in Respect of a Dangerous Structure.

as been held that in the case of the y of expenses incurred in respect of erous structure, the time limit of six commences from the date of the de- for payment and not from the time of mpletion of the work. (Labalmondiere ison, 28 L.J.M.C. 25 (1858).)

Temporary Structure.

re a temporary structure had been contrary to the Metropolis Manage- nd Building Amendment Act, 1882, ffence was held to be continuous and lings could be taken within six months the time which it continued to exist, roceedings could be commenced at any (Metropolitan Board of Works *v.* y, 54 L.J.M.C. 39 (1884).)

New Streets.

commencing to lay out a new street t proper notice it was held that the imitation of six months commenced he date of giving notice to the District or for the erection of a building situ- the side of the street. (Metropolitan of Works *v.* Lathey, 40 J.P. 245

Line of Frontage.

In the case of building beyond the general line of buildings, it has been held that the time limitation commences to run from the date of commencement to erect a building beyond the line, and not from the date of the certificate. (Paddington Vestry *v.* Snow, 45 L.T. 475 (1881); L.C.C. *v.* Cross, 66 L.T. 731 (1892).)

With respect to the erection of an illuminated sign beyond the general line of buildings contrary to section 73, subsection 8, it was held that the date at which the sign was completely fixed to the building was the date from which the time limitation of six months commenced. (This, of course, would prevent any person fixing part of the sign to the premises and completing same beyond the frontage line after the six months had expired.) (Hull *v.* L.C.C., 64 L.T. 160 (1901).)

Buildings on Low-lying Land.

In this case it was held that it could not be ascertained whether the building came under Part XI, section 122, until the buildings had been completed, such buildings being drained into a sewer that was liable to become so fully charged at times of flood or moderate rainfall as to prevent the sewage passing into the main L.C.C. sewer. Therefore, the time limitation would commence to run from the completion and not the commencement of the building. (Ellis *v.* L.C.C., 9 L.T. 206 (1904).)

District Surveyor's Fees.

It has been held that the case of the recovery of fees from the builder or owner by the District Surveyor, the time limit commenced from the date of delivery of a bill of fees to the builder or owner, as required by section 157, subsection 2, which states that: "If any such builder, owner or occupier refuses to pay the said fees, they may be recovered in a summary manner on its being shown to the satisfaction of the Court that a proper bill specifying the amount of the fees was delivered to him or sent to him in a registered letter, addressed to his last known residence." (Corbett *v.* Badger, 84 L.T. 602 (1901).)

Section 167.—Any proceedings taken by a District Surveyor may be continued by his duly appointed deputy or successor in the office.

Note.—The District Surveyor has, under section 142, the power to appoint a deputy.

Section 168.—Where jurisdiction is by this Act given to a County Court, that Court may settle the time and manner of executing any work or of doing any other thing, and may put the parties to the case upon such terms as respects the execution of the work as the Court thinks fit:

Provided that any person shall have the same right of appeal from any decision of a County Court in any matter in which jurisdiction is given to such Court by this Act as he would have under the County Courts Act, 1888, from any decision of such Court in any matter.

Note.—The judge of a County Court can, under section 94, settle the amount payable by the building owner before commencing any work, in the case of any difference between the parties, and under section 91 he can entertain an appeal to settle any difference between the surveyors appointed by the building and adjoining owners.

Under the County Courts Act, 1888, section 120 enacts that if any party in any action or matter shall be dissatisfied with the determination or direction of the judge in point of law or equity, or upon the admission or rejection of any evidence, the party aggrieved by the judgment, direction, decision, or order of the Judge may appeal from the same to the High Court, in such manner and subject to such conditions as may be for the time being provided by the rules of the Supreme Court regulating the proceedure on appeals from inferior Courts to the High Court.

Section 169.—Notwithstanding anything in any other Act, one-half of all penalties recovered by the Council under this Act shall be paid to the Council. Provided that it shall be lawful for any Court by whom any penalty is imposed under this Act to direct that the whole or part thereof shall be applied in or towards payment of the costs of the proceedings.

Note.—Under the Interpretation Act, 1889, section 2, subsection 2, the Council, if a "party aggrieved," is entitled to any forfeiture or penalty payable to a "party aggrieved."

ILLUSTRATIONS

(*Continued from page* 651.)

Cottenham Park Wesleyan Sunday School.

This building is now in course of erection and forms a complete Sunday School adjoining the church. The accommodation consists of a large main hall with classrooms on either side. This hall also has a gallery at the entrance end. In addition to the main hall there are separate departments for the juniors and primary, each self-contained with assembly lobbies and lavatories. A church parlour, library and kitchen are also provided. On the first floor is a large room for seniors and two other rooms for boys and girls. The building generally is in red brick with artificial stone dressings, the roof in red tiles and flats in asphalt.

The architects are Messrs. H. F. Murrell and R. M. Pigott, of 44, Bedford-row, London, W.C.1, the contractors being Messrs. H. Somerford and Son, of Clapham. The subcontractors were as follows:—Emerson and Norris, Ltd., and W. Baxter Elliott, artificial stone; the Aston Construction Co., Ltd., steelwork; H. J. Cash and Co., Ltd., heating and electric light; C. E. Welstead, Ltd., Croydon, steel windows and lead glazing; the Leeds Fireclay Co., Ltd., sanitary goods; James Hill and Co., Ltd., ironmongery, etc.

New Altar and Reredos, King's Weigh House Church.

The new reredos at the King's Weigh House Church, Mayfair, has been designed by Mr. A. E. Henderson, F.S.A., L.R.I.B.A., to be in harmony with the existing oak work and terra-cotta architecture of the church, for the Rev. W. E. Orchard, D.D., and Church Committee. The architect has adopted a refined Byzantine style, but instead of using marble as the Byzantines would have done, he has adapted the style to English oak. Every detail was carefully studied and drawn out full size and a complete cartoon fitted in place before work was commenced. The joiners and carvers were Messrs. John Garlick, Ltd., Cadogan Works, Chelsea. The angels were modelled by Mr. Alan G. Wyon, and the cross candlesticks were designed and executed by Mr. H. Farmer, as also the painting and gilding on the reredos.

Halifax Equitable Building Society's Premises, Bournemouth.

These premises, which were illustrated in our last issue, are at 103, Old Christchurch-road, Bournemouth. The street façade is of white Sicilian marble and cast bronze, and the windows have bronze and electro-copper glazing. The internal fittings, wall panelling and joinery are in quartered and veneered walnut and the floors in black and white marble.

The general contractor was Mr. W. A. Fussell, of Bournemouth, and the following were sub-contractors:—Hampshire Shopfitting Co., Southbourne, Hants, walnut fittings; Mr. F. P. Waltho, Wolverhampton, bronze work; Messrs. Lips, Ltd., of London, strong-room.

Mr. H. R. Collins, F.R.I.B.A., was the architect

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—Ed.

Non-slip Preparation.

Sir,—Do you know of any "non-slip" preparation that can be applied to new red quarry floors?

Ankle.

Damp Chimney Breast.

Sir,—Could any of your readers suggest a cure for a damp chimney breast, the flues of which come up on the outside of the building. There are three flues, one from the basement, which is the only one used, the others from sitting-room and bedroom. The dampness shows on the breast in the bedroom, just below the picture-rail, and is worst where the flue, which is used, passes up the breast. The dampness has been there some years, and the stack was pointed ten months ago in cement and coated with oil and varnish, and the stack and pots thoroughly overhauled.

Nonplussed.

Sound-deadening.

Sir,—Can you give me any advice on how to quieten my flat? The least movement or footfall in the rooms overhead can very plainly be heard. Any suggested remedy, with approximate cost, etc., would be appreciated.

E. S.

Teak Tops in Chemical Laboratories.

Sir,—Can any reader tell me what is the best finish for teak tops in chemical laboratories, and if there is any preparation which will prevent the staining of the teak tops?

H Munro Cautley.

Ownership of Documents.

Sir,—On leaving a position, is a clerk of works justified in carrying away copies of plans, etc., that he made on his own tracing paper for his own use? Also, can the architect demand that he hands over his note-books, diary, letter-book, and report of tests that he made of the materials, etc., delivered on the job, during his period of employment? The said books were provided by the clerk of works, and not paid for by the building owner. Is there any reported case on this point? There was no copyright in the plans.

Lancashire.

Setting up Centrolinead.

[Reply to "X.Y.Z.," October 21.]

Sir,—I have probably set up as many perspectives in my time as most men who have not specialised entirely on perspective drawing, and have tried nearly all the theoretical methods of setting up the centrolinead, but have found my own method to be the quickest and most simple to understand. This is, to draw a skeleton plan and sketch to one-eighth the full size of the finished sketch and determine thereon the vanishing points on both, and draw one raking line to each point which will come outside the drawing board on the finished sketch. It is easy to set up this raking line to scale on the full-size sketch and without actually finding the actual distant vanishing point. Next lay the centrolinead on the horizon and put in pins at equal distances from the horizon. Try this on the raking line and readjust the pins till it agrees. With experience it is possible to arrive at the correct positions with very little trial and error work, and I am quite convinced it is the speediest method.

Practice.

Cost of Houses per Foot Cube.

[Reply to "V. L. B.," October 21.]

Sir,—It may be of interest to know that in one district of the Home Counties a very good class of house is being put up for 1s. 3d. per foot, viz., houses of from £2,500 to £3,000, with central heating, etc., and good cottage work for 1s. I believe myself that these prices represent an excellent profit to any builder with a good organisation, and that prices will soon fall considerably lower when the builder's "good old days" are passed, not forgetting the subsidy. The experience of practitioners in other districts would make very interesting reading.

Home Counties.

Cleaning Old Bricks.

[Reply to "Restoration," October 21.]

Sir,—A labourer should be capable of cleaning about 200 bricks per hour if the mortar thereon is reasonably loose. A fair price for executing this operation and stacking should not exceed 10s. per thousand. There is no doubt that a great number of handsome old facing bricks are crushed up for aggregate on account of the fallacy that it costs as much as buying new. Sometimes this is, no doubt, true, but generally speaking, it is a thoroughly practical proposition to conserve them for re-use.

Waste Not.

Sir,—Two or three years ago we had a quotation for cleaning and stacking 110,000 old bricks at the rate of 27s. 6d. per thousand. These bricks were from an old warehouse built in lime mortar. It does not pay to clean bricks built in cement mortar.

Readers.

Making-up Roads.

Sir,—Can you inform me whether or not the Government has ever laid it down as a ruling, with reference to subsidy houses, that £30 will adequately cover the cost of paving the carriageway for an ordinary frontage?

S. J. P.

[It is not within the province of the Government to give such a ruling as that mentioned. The question of making-up roads is mainly one for local authorities, and the cost of such work is likely to vary in different localities.—Ed.]

Gauging Mortar.

[Reply to "Strength," October 21.]

Sir,—I know of no records of the actual relative strength of lime mortar and gauged mortar, but I recently saw demolished some work executed a few years ago, which had been built in gauged mortar, and it had all the characteristics of cement mortar, and appeared to be extremely tenacious; in fact, it was found in innumerable cases that the bricks break rather than the joints part. I am quite satisfied that the results of gauging mortar are nothing but good, and the expense over ordinary lime mortar quite trifling.

Gaugit.

Loamy Sand.

[Reply to "Youth," October 21.]

Sir,—Sharp sand is at its best if clean, but if it is not sharp, as in sandpits near the seashore, which have probably at some time been part of the shore, though now free of salt, the sand is so smooth that it has little tenacity in the mortar, and in such cases a little loam does actually help it and is no detriment as compared with the poor sand used alone, though it is not so good then as where sharp sand is obtainable. A better way of helping it is to gauge the lime mortar with cement.

Sandy.

Brick Fireplaces.

[Reply to "Ancient," October 21.]

Sir,—It is best to put fire lumps or fire-bricks to the backs of the fireplaces where the heat is concentrated, but the hobs, surrounds and hearths can be done in ordinary sand-faced bricks without risk of flying.

Architect.

EXHIBITION NOTES

Countryside Sketches.

The little exhibition of countryside sketches by T. Raffles Davison now being held in the Galleries of the Royal Institute of British Architects will, we may hope, attract not only those who are familiar with Mr. Davison's charming and characteristic work in pastel and pen and ink, but members of the general public who are beginning to take an interest in the question of the preservation of our beautiful countryside. Until recently rural England was not known to many, but the increasing use of the motor car, while in some ways a menace, has at least familiarised us with many of our villages which are still unspoilt and with coast and pastoral scenery with which we need fear no comparison. The interest which is being aroused should be stimulated by those who visit Mr. Davison's exhibition. The seventy or eighty subjects which are shown are in no sense elaborate or highly finished works, but they are all accurate records of what has appealed to an artist who has an instinct for selection of subject as well as the art to seize the pictorial note and with delicacy of handling which give to his subjects a special charm. The composition of these sketches is most pleasing, and for the most part they are not mere suggestions, nor do they depend for their success on any tricks of draughtsmanship; on the contrary, they are faithful records of some typical pieces of our beautiful countryside, and should be seen by all who are interested in its preservation.

Shagreen and Silverwork.

At the Three Shields Gallery, 8, Holland street, Kensington, there is at the present time an exhibition of silverwork showing much refinement of craftsmanship and design. Paul Cooper is an artist as well as a craftsman, and the two things are by no means inevitably joined together, and the examples of his work brought together in this pleasant little gallery sustain his reputation for the always conscientious and delicate charm of his work. Not that we would suggest that exhibits to be all equally good, or of the same importance. The use made of picked pieces of skin of natural colour deftly combined, in addition to the use of the traditional green shagreen, gives variety and interest to the examples. If we have to find a criticism which in no way affects the general high quality of the work, it is in a certain disparity of treatment between the ornament of the locks and the treatment employed elsewhere. It would benefit the ornament were it a shade less naturalistic and included more severity of design. No. 50, big oblong box natural skin, is very successful. Nos. 70 and 74 are two others which are to be much admired. No. 92 shows silver fruit-dishes inlaid with mother of pearl; and No. 110, pot pourri jar; the former raised on stems supporting the silver dishes ornamented in the way described, and the latter with its well designed perforated top, should be noticed, as also some circular boxes of shagreen and a fine chalice. Among the jewellery are small metal examples are many ingenious wrought and of good design. In this artist's work we feel the hand of an accomplished craftsman, cunning in the use of his materials, and able to shape them into forms of beauty. The exhibition closed on October 27.

At the same gallery are to be seen some agreeable studies of roses in oil by F. Ernest Jackson, which show appreciation in the treatment. Though literal rather than suggestive, they are good examples of the artist's thorough workmanship. If they have not the perfume, the royalty of the rose is none the less finely portrayed. Imagination is the only insight into the deepest secrets of form which is seen with the "inward" eye. But these small studies are well worth possessing, and have their own character, though lacking the romance with which Fantin Latour could invest a flower.

THE BUILDING TRADE

THE UNEMPLOYMENT INSURANCE BILL

The Unemployment Insurance Bill now produced consists of but fourteen clauses, and it is accompanied by a Memorandum which indicates the paragraphs in the unanimous Report of the Blanesburgh Committee containing the recommendations upon which the Bill is founded.

Clause 1 provides "An insured contributor who is unemployed shall, if he proves that the statutory conditions are fulfilled in his case and if he is not disqualified under the Unemployment Insurance Acts for the receipt of benefit, be entitled, subject to the provisions of those Acts, to receive benefit." This clause, with certain repeals set out in the Fifth Schedule, is intended to carry out the recommendation contained in Par. 67 of the Report: "We have accepted the principle advocated on all sides that extended benefit as such shall disappear. Under our proposals there will be only one kind of benefit. To that benefit the contributor, if he complies with the conditions, shall be entitled according to these conditions."

Clause 2 adopts the recommendation of the Committee contained in paragraph 58 of the Report in that it creates an intermediate class of insured persons between men and women and boys and girls, viz., young men and young women between the ages of 18 and 21, with new rates of contribution and benefit. The rates of benefit for all classes we will consider together, but first we may refer to Clause 3.

In paragraph 64 of their Report the Committee stated that their scheme for permanent Unemployment Insurance as regards contributions and benefit were calculated on the basis of a trade cycle over a period of from 10 to 15 years, but as it was impossible to predict whether the scheme would commence at a time when unemployment was light or heavy to obviate the accumulation of either a surplus or a deficit there should be an actuarial inquiry into the state of the fund every five years. Sub-Clause 3 carries out this suggestion. "The Minister shall once at least in every five years, and if he thinks proper so to do, may at shorter intervals, cause an investigation to be made in such manner as the Treasury may approve into the financial position of the unemployment fund and the Minister shall lay before Parliament a report of any investigation made under this section."

Rates of Benefit.

It is important to observe that this Bill is not to come into force, except as otherwise expressly provided, until April 19, 1928 (Clause 14 (5)). The rates of benefit are dealt with in Clause 4 and the Third Schedule. The recommendations of the Committee as regards rates of benefit have been adopted. That is to say, the weekly rate for men is to be 17s. instead of 18s., for women 15s. (unchanged); but the rate in respect of an adult dependant is raised from 5s. to 7s.

In respect of dependent children the rate is 2s. as at present.

The rates for young men aged 18 to 21 is to be 10s. and for young women 8s. Boys aged 16 to 18s., 6s. in place of 7s. 6d., and girls of the same age, 5s. in place of 6s. This follows the table in the Report in paragraph 58.

These rates are to come into force April 19, 1928 (Clause 4), but as regards the new class of young persons the rates of benefit will not come into force until the insurance year July, 1928 (Clause 2), but between the commencement of this Bill (April 19, 1928) and July 5 they will be entitled to the same rate as persons who have attained 21 years (Clause 4).

Rates of Contributions.

The Bill appears to make no changes in the rate of contribution by employed persons except in the case of the new class created by Clause 2, the young men and women of 18 to 20, so for the purposes of comparison we take the rates as laid down in the Unemployment Insurance Act, 1925, which we believe are the rates in force, and place them in juxtaposition with those recommended by the Committee, but in doing this it must be explained that the Committee laid down two scales of rates, first the normal and then a rate which should be put in force until the debt on the fund was liquidated and thus the present rates must be compared with the latter scale.

	Present Rate.	Committee's Rate.	Rate in Bill.
Men	7	6	—
Women	6	4	—
Young Men, 18 to 20	—	5	6
Young Women	—	3½	5
Boys, 16 to 18	3½	—	2½
Girls	3	—	2

An exact comparison is not possible, for the Committee's figures as we have shown above, relate to the deficiency period or "extended period," whereas the present rate will be reduced to some persons if the extended period continues after January 1, 1928 (see Schedule II, Part II, Act of 1925), and the figures given in the Bill which relate to the new class are to continue until the expiration of the extended period as defined in Section 4 of the Act of 1925 (see Clause 2 (2)).

It may be said here that the Bill does not touch the Government contribution except that in the Second Schedule the rates on which the Government contribution are to be calculated for the new class of young persons is given as 5½d. for a young man and 3⅜d. for a young woman. The rates on which the contribution in respect of other persons is calculated will be found in the Economy (Miscellaneous Provisions) Act, 1926, Schedule II.

Dependants.

The Bill is drafted by reference to sections of previous Acts which are amended in a piecemeal fashion, so the effect is not always easily found out, but it appears that the recommendations of the Committee that dependant benefit should not be payable to a woman living with a man but not married to him unless there are dependent children, but that it should be payable in respect of a mother though unmarried, and in respect of a widowed stepmother and a mother whose husband is disabled from work, and to either a man or woman who has residing with him or her a female person who has the care of dependent children, have been adopted in Clause 4 subclause (2).

Conditions for Receipt of Benefit.

Clause 5 subclause (1) adopts the recommendation of the Committee that not less than 30 contributions shall have been paid in respect of an insured contributor in respect of the two years immediately preceding the date on which the application is made. But by Clause 5 subclause (5) an exception is made in the case of disabled ex-Service men who prove that the non-fulfilment of this first condition is due to disability contracted in the war, when 15 contributions will serve for qualification. Some such modification as this was recommended by the Committee in the Report (par. 164). There are provisions as to the transitional period, on this Bill coming into force, in Clause 12. Another provision recommended by the Committee in par. 85 finds a place in Clause 5 subclause (4) which provides that if an applicant proves he was unable to comply with the condition requiring 30 contributions in respect of the two years immediately preceding his application owing to some specific disease or to bodily or mental disablement the periods of incapacity thus caused shall increase the period, but so that the whole does not exceed three years.

The Committee laid great stress on the fact that applicants should be "genuinely" seeking work, and we should have liked to see how the amendments introduced conduce to this end, but as the Bill is drawn its effect can only be ascertained by numerous references to, and amendments made, in many sections of the Unemployment Insurance Acts and the Memorandum is not a very efficient guide to its provisions, so space will not permit of our doing this, and we can only notice one provision under this heading. Clause 5 subclause (2) (ii) provides "After the lapse of such an interval from the date on which an insured contributor becomes unemployed as, in the circumstances of the case is reasonable, employment shall not be deemed to be unsuitable by reason only that it is employment of a kind other than employment in the usual occupation of the insured contributor, if it is employment at a rate of wage not lower, and on conditions not less favourable, than those generally observed by agreement between associations of employers and employees, or, failing any such agreement, than those generally recognised by good employers." This provision is the result of a recommendation contained in general terms in paragraph 95 of the Report.

The Trade Dispute Disqualification.

In an article in our issue for May 6 we set out at some length the recommendations of the Committee on the Trade Disputes disqualification (pars. 130-140). It involves consideration of several statutes, and we cannot set out the whole matter here, but Clause 6 of the Bill appears to have carried out the two concrete recommendations of the Committee in the following amendment of Section 4, subsection (1), of the Unemployment Insurance (No. 2) Act, 1924. That section as now amended will read: "Subsection (1) of Section 8 of the principal Act" (1920) "(which imposes a disqualification for the receipt of benefit during a stoppage of work) shall not apply in any case in which the insured contributor proves that he is not participating in or financing or directly interested in the trade dispute which caused the stoppage of work and that he does not belong to a grade or class of workers *of which immediately before the commencement of the stoppage there were members employed at the premises at which the stoppage is taking place any of whom* are participating in or financing or directly interested in the dispute." The words in italics are those introduced by the Bill and the remaining portion of the section is repealed. The recommendations of the Committee were directed to confining the disqualification to grades and classes involved in disputes at the actual premises where the insured person was employed (see par. 138), and the words now inserted carry out their recommendation, whilst as regards the last portion of the section now to be repealed the Committee considered it prejudicial to industrial stability as discouraging long-time agreements and collective bargaining (see pars. 139 and 140).

The latter portion of the section, now to be repealed, is as follows:—"Or that the stoppage is due to an employer acting in a manner so as to contravene the terms or provisions of any agreement exist-

ing between a group of employers where the stoppage takes place, or of a national agreement, to either of which the employers and employees are contracting parties." The full reasoning of the Committee was set out by us in our former article.

We may conclude this very imperfect notice of this Bill with one illustration as to the difficulty of tracing the Committee's recommendations in its provisions. In paragraph 159 of the Report the Committee pointed out that hardships arose where a man accepted part-time employment when out of regular employment and thus lost his benefit, and one illustration was given: If a man acts as cinema attendant or porter and has always done so in addition to his regular employment he can, on losing his regular employment, draw benefit though still continuing this part-time occupation; but as the law now stands it is otherwise where he has not engaged in part-time employment before losing his regular work, and the Committee suggested this should be remedied.

This suggestion is adopted in the Bill as follows in Clause 5 subclause (1) (*c*): "Section 7 of the principal Act shall be amended as follows: 'in paragraph (*a*) of subsection (2) for the words "has ordinarily been followed" there shall be substituted the words "could ordinarily have been followed."'"

This effects the object desired by the Committee but affords an excellent example of the difficulty of tracing the recommendations in the Bill. With this amendment the section will read: "A person shall not be deemed to be unemployed on any day on which he is following any occupation from which he derives any remuneration or profit, unless that occupation could ordinarily have been followed by him in addition to his usual employment and outside the ordinary working hours of that employment and the remuneration received therefrom in respect of that day does not exceed 3s. 4d., or where the remuneration is payable in respect of a period longer than a day, the remuneration does not on the daily average exceed that amount."

The report of the Committee outlined in plain language a Permanent Unemployment Insurance Scheme which, with other amendments suggested in the law, could be easily followed and understood, and it is to be regretted that the exigencies of drafting these suggestions into a great number of existing statutes must inevitably prevent the scheme being presented in the Bill in an intelligible form. To follow the Bill the closest study of the existing statutes is required, as we have shown, and such Bills as these cannot be followed by ordinary persons, and when they come to be considered in Parliament it is to be doubted whether the majority of Members have time to master their intricacies. We suggest that a very much more complete Memorandum should accompany this Bill than that at present available.

Lectures and Demonstrations in Smoke Inspection.

In connection with the Public Health (Smoke Abatement) Act, 1926, which came into operation on July 1, the Ministry of Health in their Circular 759 suggested that the officials responsible for the abatement of smoke nuisances should be specially qualified and that there should be special courses of training. In 1912 the Royal Sanitary Institute established an examination qualifying for the post of smoke inspector, and in order to assist candidates who are preparing for this examination they have arranged for a course of ten lectures covering the syllabus of the examination and for practical demonstrations at works illustrating the management and working of different types of furnaces. Particulars of the lectures may be obtained on application to 90, Buckingham Palace-road, S.W.1.

An Engineer's Estate.

Mr. C. L. S. Isler, of Wellington-road, St. John's Wood, and of C. Isler and Co., artesian well engineers, of Bear-lane, S.E., who died on September 20, left £20,262.

POINTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—III.

NOTICES TO QUIT—(*Continued*).

In our observations upon tenancies for parts of a year we have had incidentally to allude to tenancies from year to year, but we must refer to yearly tenancies more particularly.

Tenancies from Year to Year.

A tenancy may be created "for one year" or "for one year certain," but that is not a tenancy from year to year and it will terminate without any notice to quit (Cobb *v.* Stokes, 1807, 8 East 358). A tenancy from year to year may be created either by the use of such words as "from year to year," or, as we have shown in our earlier articles, it may be implied from the general terms of the agreement such as where the rent is stated to be at so much a year (King *v.* Eversfield, 1897, 2 Q.B. 475), even though it is to be paid in quarterly payments.

In a tenancy from year to year where no special terms as to notice are inserted in the agreement it is terminable by six months' notice expiring at a date corresponding with that on which the tenancy commenced. But if the agreement provides for less than six months being given in the notice to determine the tenancy the notice to quit must expire with the termination of any year of the tenancy (Lewis *v.* Baker, 1906, 2 K.B. 599).

But in a tenancy from year to year the tenancy cannot be determined within the first year. This is shown in the case Mayo *v.* Joyce (1920, 1 K.B. 824; *The Builder*, March 26, 1920). There by the tenancy agreement premises were let at a rent of £60 per annum, payable on the usual quarter days, and it was provided "The tenancy shall commence on September 1, 1918, to continue from year to year until determined by three calendar months' notice to quit which may be given on either side and at any time irrespective of dates fixed hereunder for the payment of rent." On April 29, 1919, the landlord gave the tenant notice to quit which would expire August 2, 1919. A Divisional Court held that the agreement created a yearly tenancy which was to exist for one year certain and then to continue until determined by notice to quit "at any time," those words being inserted to make it clear that the notice need not expire on a date corresponding with that on which the tenancy commenced or on one of the days on which the rent was to be paid, but they did not permit of the tenancy being determined before the end of the first year and the notice was therefore bad.

This case follows the principle adopted in an earlier case, Soames *v.* Nicholson (1902, 1 K.B. 157), where a tenancy had subsisted for some years. There by an agreement of tenancy the premises were let "from May 1, 1895, at a yearly rent of £40 payable by equal payments every three months in advance if required on May 1, August 1, November 1, and February 1, in each year. . . . Subject to three months' notice on either side *at any time* to terminate the agreement." On January 24, 1901, the landlord had given the tenant notice to quit on April 25, 1901. A Divisional Court held that although the general rule was that a yearly tenancy can only be put an end to by a notice expiring at a date corresponding to that of its commencement, yet if the parties choose they can stipulate that the tenancy shall be determined at any time, and as they had done so the notice was good.

Holding Over.

It may be convenient to point out here that there is another way in which a tenant may become a tenant from year to year, and that is where after the termination of an existing agreement or lease he holds over without entering into any fresh agreement, both parties consenting to accept the relationship of landlord and tenant on those terms. Perhaps this is most clearly stated by the Court of Appeal in the case Doug *v.* McCarthy (1893, 1 Q.B. 736), where Lo Esher said that it is a question for the ju whether the facts imply consent of both pa ties, but suggested that the mere holdi over of a tenant would be sufficient to imp his consent unless he made some stateme inconsistent with his remaining on as tenan If a tenant remains on without saying an thing, that is to say, if the consent of bo parties is proved or thus implied, then h holds as tenant from year to year on t terms of the old lease so far as those term are consistent with a tenancy from year t year (see Dougal *v.* McCarthy). A deman for or acceptance of rent on the terms the expired lease or agreement would co firm, the implication of the intention of th parties (see the above case). As to the cov nants imposed under the original lease whi will apply in such cases we shall deal wi this hereafter.

When a tenant holds over and a tenanc from year to year is implied, there may certain cases be a difficulty in determini when the notice to quit must be given. recent case, Croft *v.* W. F. Blay (1919, 1 C 277; *The Builder*, July 25, 1919), illustrat this difficulty. There an agreement tenancy, dated November 15, 1915, provid that the premises should be let "for the ter of one year and an eighth of another year the yearly rent of £40, payable quarterly the usual quarter days, the first payment be for the half quarter ending December 25. This is not an unusual arrangement when t tenancy begins in mid-quarter. The tena held over after the expiration of the term December 25, 1916, and rent was accepte for the next quarter ending Lady Day, 191 but on June 8, 1917, the landlord gave t tenant notice to quit at Christmas, 1917. T tenant refused to accept this notice, conten ing that the tenancy commenced on Nove ber 11, and the proper notice would be s months before November 11, and the fo lowing statement of the law, which first a peared in Cole on Ejectment, but which h since been repeated in text-books, w relied upon. "Generally speaking, an i plied tenancy from year to year created the payment and acceptance of rent after t end or determination of a previous term w be deemed to have commenced at the sam time of year as the original term, and noti should be given accordingly, and this ru prevails even when the original term did n cease at the same time of year at which commenced." The Court of Appeal held th there was no such rule as that laid down the closing part of the above quotation, t tendency of the cases being to show th where rent was payable on one of the usu quarter days the yearly tenancy should treated as commencing or ending from o of the usual quarter days, unless there w some express provision in the agreement lease contrary to any such presumption.

In this case it must be observed there w a provision in the agreement as to the ren making the half-quarter's rent payable at t next quarter day, but presumably, if th tenancy had commenced on some date b tween quarter days, and the agreement ha contained no reference as to quarter da leaving the rent to be paid at three month periods, then the tenancy would have bee presumed to commence from the date name

We have shown above, in the case of Mayo Joyce, that where a yearly tenancy is creat the tenancy cannot be determined within t first year, and the same principle appli where the term granted is a certain perio exceeding a year. Thus in Brooke *v.* Sear (1912, 1 Ch. 610) the demise was "for tw years certain, and thereafter from year year until either party gives a three-month notice to determine the tenancy," and it w

ld that the lease was not determinable at e end of the two years, but only deter- nable by a notice expiring at the end of the rd or any subsequent year; thus, in fact, was a lease for at least three years.

Similarly, in W. Davis & Son *v.* Lanca- re and Yorkshire Bank (1914, 1 Ch. 522), ere by a lease dated February 21, 1911, emises were demised for a term of five ars from March 25, 1911, at a rent to be id quarterly on the usual quarter days, d it was provided, "After the expiration the first three years . . . if the lessee all desire to determine this lease and shall ve to the lessors six calendar months' notice writing of such desire, such notice to de- rmine on any quarter day . . . then, and mediately on the expiration of such notice, is present demise shall cease and be void." was held, on the authority of Gardner *v.* gram (1889, 61 L.T. 729), that the earliest te on which the tenancy could be deter- ined was September 29, 1914, and a notice ven to determine the tenancy on June 24, 14, was bad. In Gardner *v.* Ingram the rms of the lease were much the same, except at it was provided that the six months' tice must expire on the quarter day corre- onding to that on which the tenancy com- enced, and thus, in that case, it was held at a tenancy of at least four years was eated.

Notices to Quit by Purchasers.

We may conclude this article with a refer- ce to two points not mentioned in our pre- ous observations as to notices to quit. In Irish decision, Braham *v.* McIlwaine 918, I.R. 353), it was held that a purchaser the open market cannot give a notice to it to a tenant who is in occupation of the nds purchased, in his own name, between e payment of the purchase money and the ecution of the conveyance, and in such cir- mstances the notice should be signed by th vendor and purchaser, or by the pur- aser as the expressly authorised agent of e vendor. The converse principle was also d down in the English Courts in the case ffety *v.* Schofield (1897, 1 Ch. 937), as llows: "As between the vendor and pur- aser of a property which at the date of e contract is in the occupation of a tenant, e purchaser is, generally speaking, entitled have the property preserved pending com- etion in its existing state, and the vendor uld not only not be entitled as against the rchaser's desire to determine the tenancy, t if he did determine it he would be liable the purchaser for any loss thereby cruing."

Parties to Notices to Quit.

Attention has to be paid to the terms of e agreement enabling tenants to give notice their intention to quit. In Humphrey *v.* renbury (1909, 1 Ch. 244) it was decided at where a lease contained a proviso abling the "lessees" to determine the se by notice, a notice given by one of two sees will not, in the absence of evidence authority from the other lessee, or of cir- mstances from which the Court can infer ch authority, be effectual to determine the se.

The New Subsidy House.

The Ministry of Health, it is stated, are tching closely the cost of building houses ce the subsidy was reduced on October 1. Nottingham houses have now been ap- ved that will cost £332 each. These are the same type of house that cost in 1925/ in contracts in the city £540 to £600 each. Leeds it is believed that economies may effected by erecting cottage flats. These to be built in blocks, and the estimated t is £300, apart from the cost of site rks and streets. In order to encourage a ther drop in prices the Ministry is insist- that local authorities should fix as the ximum selling price of subsidy houses ilt by private builders £550 instead of 00 as last year.

WARMING OF CHURCHES, PUBLIC BUILDINGS, ETC.

Sir,—You published in your issue for September 30 an article recommending steam heat and more particularly referring to churches only requiring heat on Sundays. The article particularly recommended vacuum heating for quickly raising heat in such cases.

In case anyone should be led astray by such remarks may I briefly point out, first, that sudden heating after the manner described is the chief cause of cold draughts down the centre of the nave, and, secondly, that the only churches used once weekly are village churches, and even were electricity available for the vacuum pump, the writer can never have met the typical village verger or he would not advise a vacuum steam installation. I never saw a clean, tidy, cared-for village church boiler-house, and the damp would destroy any vacuum pump.

I was called in recently to report upon a defective church heating installation, and found that the flues of the sectional boiler had not been swept for two years, and, of course, last winter's ashes were still on the grate.

Your next article in the same issue, written by A. W. B., starts off with the extraordinary statement that the heating of buildings by exhaust steam has not received the attention it deserves, and he describes in considerable detail methods which have been in daily use for forty years or more, in hundreds—I might say thousands—of buildings, and his illustrations of pipe work are such as we continually had on our drawing-boards thirty years ago, and, unless I am much mistaken, long before the firm whose fittings he recommends were selling goods in this country.

S. Whitmore Robinson.

[***We have communicated with the writers of the two articles referred to and give their replies herewith.—Ed.]

Sir,—The statements made by your correspondent would lead one to think that the title of my article was "The Warming of Village Churches," instead of the title under which it appeared. I had not the village church in mind; such edifices, being usually small, are not difficult to warm; in fact, many of them are quite comfortably warmed, in spite of the fact that the heating apparatus may be of a rather old type. Certainly I do NOT refer to the *sudden* heating of any building. Cold draughts have been overcome by warming the upper volume of air by overhead heating surface in churches that were not warmed suddenly and not very quickly. The actual cure of a trouble is the thing connected with it which matters most.

In the article I do not recommend steam, vapour, or vacuum installations for warming village churches; I would only recommend such installations for such buildings as cathedrals, abbeys, and those churches in towns which, whilst rather extensive, are not warmed for the less important services of the week.

Let me give two instances of unsatisfactory warming by hot water — numerous others could be given. One of our largest cathedrals is heated by a battery of hot-water boilers; in the colder months of the year, after first lighting the fires in the boilers, it takes a full week to get the huge building as warm as it is possible to get it by the means available; and not the most enthusiastic admirer could ever claim that it is satisfactorily warmed, and the down-draughts of cold air are uncomfortable and annoying.

Instance No. 2.—The preacher at one of the best-known churches in the south-west district of London said to me last winter, "This church is supposed to be warmed by hot water, but it never is warm!" Since your correspondent claims that cold draughts are caused by sudden heating, will he please state how many places of worship in this country are heated suddenly? He seems to have overlooked the fact that I referred to *down* draughts from overhead.

It is not possible in a short article, nor in a text-book, to mention types of apparatus that are suitable for each separate building; this is a matter to which the capable engineer applies his judgment. I should no more think of advising that a steam- or vacuum-heating apparatus be installed in a village church than I should think of advising a small jobbing builder to purchase an expensive motor lorry when a small hand-truck would be much better and cheaper for his requirements.

I must point out that I do not "particularly recommend" vacuum for any small church. In the article I state that it is now possible to guarantee *noiseless steam heating*, which is a matter of the very first importance in a church, or any building that is used for public speaking." I mention a number of other advantages, all of which hold good. If your correspondent reads the article carefully he will find that I recommend a vacuum pump for buildings *several stories high*. How does he class such buildings with a small church? I fully agree with your correspondent's statement that the heating boilers of many village churches are badly neglected; such troubles are not unknown to me.

We are a conservative nation, and rather inclined to stick to the methods used by former generations. But a visit to the United States convinced me that their places of assembly are much better warmed than is the case generally in Britain, and in America steam as a heating agent is in almost universal use.

The Writer of the Article.

Sir,—Your correspondent makes a rather tall statement when he claims that there are thousands of exhaust steam-heating plants in this country. Had he mentioned where a dozen such installations are in actual operation, his statement would have been far more convincing. But even supposing that a great number of such installations are in operation; there are still a far greater number of buildings where exhaust steam-heating could be installed, with the result that the employer would profit, and the worker would benefit; consequently my statement is not wide of the mark.

I rather think that your correspondent confuses heating by exhaust steam with heating by hot water by means of a calorifier, the latter receiving its heat from exhaust steam; but that is a method that is totally different from heating by exhaust steam, direct. Hot-water heating installations which receive their heat from a steam calorifier are fairly common in this country; further, they have been in use for the period your correspondent mentions, as also have such special fittings as the back-pressure valve, the oil-separator, and the pressure-reducing valve. But will your correspondent tell us whose thermostatic steam trap he used in this country 30 years ago? This very useful appliance, which has brought about some wonderful improvements in steam heating, has been used for a number of years in America, but it is only comparatively recently that it has been used in Britain, where steam heating, of any kind, is not extensively employed.

It would be better if your correspondent kept to facts. I do not recommend the fittings of any particular firm. No firm, English or American, is mentioned in my article; but one very suitable illustration happened to have the name of a firm upon it. Heating by exhaust steam has not yet received anything approaching the attention it deserves in this country; nor, for that matter, has hot-water heating by means of a calorifier which derives its heat from exhaust steam.

A. W. B.

(For rates of wages in the Building Trade in Scotland see page 676.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed, that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, etc., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

Nov. 9.—**Hartlepool.**—Tower.—Reinforced concrete water tower and supports, etc., at Howbeck house, West Hartlepool, for B.G. A Kinder & Son, Consulting Engineers, 33, Fitzroy-sq., London. Dep. £2 2s.

Nov. 10.—**Leicester.**—Houses.—69 houses and 12 flats in Belper, Surrey and Weymouth-streets, for T.C. J. S. Fyfe, A.R.I.B.A., Housing Architect. Dep. £2 2s.

Nov. 9.—**London.**—Employment Exchange.—Erection of, at Camden Town, N.W., for the Commissioners of His Majesty's Office of Works, Contracts Branch, King Charles-st., London, S.W.1. Dep. £1 1s. (Cheques payable to the Commissioners.)

Nov. 10.—**London.**—Houses.—Erection of 12 double-tenement houses on the Flanders site, High-st. South, East Ham, for the Borough Council. Borough Engineer, Town Hall, East Ham, E.6. Dep. £2.

Nov. 10.—**Ramsgate.**—Houses.—Erection of 104 non-parlour type houses on the Margate Housing site, for the Corporation. Borough Engineer's Office, Ramsgate.

Nov. 10.—**Ramsgate.**—Houses.—Erection of 38 parlour-type houses on the Margate-rd. Housing site, for the Corporation. Borough Engineer's Office, Ramsgate.

Nov. 10.—**Sunderland.**—Houses.—54 four-roomed houses and 28 three-romed houses at Newcastle-rd. (Crozier-st. site), for C.B. B.E. Dept. £2 2s.

Nov. 11.—**Droxford.**—School.—Erection of a new Council school at Droxford, for the Southampton County Council. A. L. Roberts, County Architect, The Castle, Winchester. Dep. £1 1s., payable to the Hants County Council and crossed "Lloyds Bank, Ltd., Winchester."

Nov. 11.—**Staffs.**—Roadways, Sewers, Houses.—Layout of the site, construction of roadways, sewers, etc., and the building of 116 houses on the Tividale Hall estate Housing scheme, for the Rowley Regis U.D.C. Stanley A. Griffiths, 87, High-st., Stourbridge, Architect to the Council. Dep. £2 2s.

Nov. 12.—**Swanage.**—Houses.—18 on housing site at Herston, for U.D.C. F. Cambie, S.

Nov. 12.—**Wellington (Salop).**—Houses.—64 non-parlour type on Orleton-lane housing site, for U.D.C. W. Walker, E. and S. Dep. £2 2s.

Nov. 14.—**Brighton.**—Extension.—Tall chimney, 120 ft. high, seatings and flues for two new boilers, economiser setting, and alterations and additions to existing boiler-house at pumping station, Patcham, near Brighton, for C.B. A. B. Cathcart, Waterworks Engineer, 12, Bond-st. Dep. £5.

Nov. 14.—**Edinburgh.**—Demolition.—Of old buildings at 67, 68, 69, Shore, and 1, 2, 3, 4, 5, 6, 7, 8, 9, Queen-st., Leith, for Leith Improvement scheme, for T.C. B.E.

* Nov. 14.—**Guildford.**—Flats and Houses.—Erection of 80 flats in three types of 20 blocks and 24 non-parlour houses in three types on the Aldershot-rd. housing site, for the B.C. of Guildford. J. W. Hipwood, Assoc.M.Inst.C.E., B.E., Tuns Gate, Guildford.

Nov. 14.—**Leeds.**—Staircase.—Fire-escape staircase for Oulton Hall, near Leeds, for West Riding E.C. Percy O. Platts, A.R.I.B.A., West Riding architect, County Hall, Wakefield.

Nov. 14.—**Leeds.**—Installation.—Of hot water apparatus at Oulton Hall, near Leeds, for West Riding E.C. Percy O. Platts, A.R.I.B.A., West Riding architect, County Hall, Wakefield.

Nov. 14.—**Newport (Mon.).**—Demolition.—Of temporary bridge over River Usk, for C.B. Mott, Hay and Anderson, engineers, 9, Iddesleigh House, Caxton-st., Westminster, S.W.1. Dep. £2 2s.

Nov. 14.—**Smethwick.**—Houses.—Erection of 100 non-parlour type houses on the Slatch house estate, Warley, for the Housing Committee of the County Borough of Smethwick. Roland Fletcher, Assoc.M. Inst.C.E., Borough Engineer and Surveyor, Council House, Smethwick. Dep. £5 5s.

* Nov. 16.—**Bexhill.**—Practical Subjects Centre.—Erection of in London-rd., Bexhill, for the B.C. George Ball, Assoc.M.Inst.C.E., B.S., Town Hall, Bexhill-on-Sea. Dep. £1 1s.

Nov. 16.—**Clacton-on-Sea.**—Sanitary Work.—Enlargement of the West Avenue underground public conveniences, and for the provision and fixing of

ejection plant at the West Cliff conveniences for the Clacton U.D.C. Surveyor to the Council, Council Offices, Clacton-on-Sea. Dep. £1 1s.

* Nov. 16.—**London.**—Baths.—Superstructure and execution of other works relating to proposed new public baths and washhouses at Old Ford-rd., Bethnal Green, for the Metro. Borough of Bethnal Green. A. E. Darby, A.M.I.C.E., B.E. and S., Town Hall, Cambridge-rd., Bethnal Green, E.2. Dep. £5.

Nov. 21.—**Southend-on-Sea.**—Wall.—Shelter, about 78 ft. long by 14 ft. wide, comprising retaining wall, pile foundations and promenade roof, etc., at Leigh Cliffs, Cliff-parade, Leigh-on-Sea, for C.B. R. H. Dyer, B. E. and S. Dep. £2.

Nov. 22.—**Chester.**—Houses.—152 on Eaton-rd. site, for T.C. C. Greenwood, City E. Dep. £2 2s.

Nov. 24.—**Yorkshire.**—Repairs and Materials.—War Dep. Contracts for repairs of W.D. buildings and supply of building materials for the term Contract, from Nov. 24, 1927, at Catterick Camp. Commanding Royal Engineer, Northumbrian area, Royal Engineer Office, Catterick Camp, Yorks.

Nov. 28.—**London.**—Houses.—Erection and completion of four houses of the A2 type on a site at Chevening-rd., for the Council of the Metro. Borough of Greenwich. Borough Engineer's Department, Town Hall, Greenwich. Dep. £2 2s.

Nov. 28.—**London.**—External Painting and Redecorating Work.—At the Town Hall, Peckham-rd., Camberwell, S.E.5, for the Camberwell Borough Council. William Bell, Borough Engineer and Surveyor, Town Hall, Camberwell, S.E.5.

——.—**Belfast.**—Villas.—Villa, facing Balmoral-av.; villa, corner of Balmoral-av. and Shrewsbury-park; villa, facing Shrewsbury-park, Belfast, and making-up with curbs and channels 300 yds. of roadway, 35 ft. wide, at Bay Lands estate, and villa, Fifth-av., Bay Lands estate, Bangor. G. O'Neill, M.R.I.A.I., 26, Corn Market, Belfast.

*——.—**Bournemouth.**—Alterations and Additions.—Structural alterations and additions, premises 82, Old Christchurch-rd., Bournemouth. Timothy White and Co., Ltd. (Construction Dept.), 30, Chandos-st., Portsmouth.

——.—**Cerne.**—Cottages.—Pair of semi-detached at Melcombe Horsey, for R.D.C. C. S. Randall, C., Cerne Abbas, Dorchester.

——.—**Lochmaddy.**—Extensions.—To Long Island Combination Poorhouse at Lochmaddy. D. Cattanach, architect, Harris.

——.—**London.**—School.—In Charlton-rd., S.E. F. A. Walters, architect, 28, Gt. Ormond-st., W.C.1. Dep. £2 2s.

——. — **Mansfield.** — Enlargement. — Of Grand Theatre. J. Tomlinson, architect, Victoria-st., South Normanton.

——.—**Oxenhope.**—Reconstruction.—Also improvements to National Church schools. T. L. Dixon, architect, Stanwix House, Buttershaw, Bradford.

——.—**Picton.**—Houses.—Houses, farm buildings and adaptation work to existing premises at Picton Hall and Lower Picton Farms, for Cheshire C.C. R. Douglas Wright, County Land Agent, 16,

——.—**Southam.**—Houses.—Eight Scullery houses. H. Thompson, architect, Elland.

MATERIALS, ETC.

Nov. 1.—**London.**—Blocks.—24,000 creosoted yellow deal paving blocks, for Islington B.C. B.E. Nicholas-st., Chester.

Nov. 8.—**Dublin.**—Builder's Materials.—For United Tramways Co. G. Marshall Harriss, General Manager, 59, Upper Sackville-st.

Nov. 12.—**Bradford.**—Highway Materials.—For Corporation Tramways Committee. R. H. Wilkinson, General Manager, 7, Hall Ings.

Nov. 12.—**Dublin.**—Various Materials.—For Gt. Northern Railway (Ireland), Ltd. F. C. Wallace, secretary, Amiens-st. Station, Dublin.

Nov. 12.—**East Sussex.**—Road Material.—For C.C. H. E. Lunn, C.S., County Hall, Lewes.

Nov. 14.—**Dublin.**—Pipes.—Steel pipes and castings, 24 inches and 18 inches in diameter, for C.B. B.S.

Nov. 17.—**Norfolk.**—Highway Materials.—For C.C. S. H. Warren, C.S., 9, Queen-st., Norwich.

Nov. 19.—**West Riding.**—Materials.—Highway materials, for C.C. West Riding Surveyor, County Hall, Wakefield.

Nov. 21.—**West Sussex.**—Highway Materials.—For C.C. H. W. Bowen, C.S., Southgate House, Chichester.

ENGINEERING, IRON AND STEEL.

Nov. 1.—**Govan.**—Water Supply.—Supplying, laying, jointing and testing 1,000 lin. yds. of 6-in. diameter cast-iron supply pipes and of about 800 lin. yds. of 4-in. diameter cast-iron rising main and other relative work, and (2) for construction of reinforced concrete service tank and one mass concrete collecting tank and other relative work, at Caldwell, for District Board of Control. Warren & Stuart, engineers, 94, Hope-st., Glasgow. Dep. £1 1s.

Nov. 2.—**Birmingham.**—Footbridge.—Over River Rea, at Northfield, for T.C. H. H. Humphries, City E. and S.

Nov. 2.—**Hunstanton.**—Sewerage.—Supplying and laying glazed stoneware and cast-iron sewers, constructing manholes, flushing chambers, ventilating shafts, one ejector chamber, concrete tidal storage, precipitation and screening tanks, cast-iron outfall pipe and other works incidental thereto in connection with proposed sewage outfall works and South Beach sewerage, for U.D.C. F. Wilkinson, E. and S.

Nov. 4.—**Llandovery.**—Water Supply.—Supplying, laying and jointing of cast-iron and other pipes, with valves and fittings, together with construction of a service reservoir, gauging and collecting chambers, and other contingent works necessary for completion of Llangadock water scheme, for R.D.C. J. Owen Parry, M. and C.E., Arcade-chambers, Ammanford. Dep. £3 3s.

Nov. 7.—**Braintree.**—Extensions.—To sewage disposal works comprising screening chamber, detritus and sedimentation tanks, new sludge beds and humus tanks, alterations to No. 4 dosing chambers and filters, etc., for U.D.C. Sands & Walker, Engineers, Milton-chambers, Nottingham. Dep. £2 2s.

Nov. 7.—**Clones.**—Reservoir.—Also other works incidental thereto, for U.D.C. P. H. McCarthy, Engineer, 26, Lower Leeson-st., Dublin. Dep. £3 3s.

Nov. 8.—**Earby.**—Reservoir.—Construction of an impounding reservoir at Bawhead, for U.D.C. E. J. Silcock, Consulting Engineer, 25, Victoria-st., Westminster, S.W.1 Dep. £5.

Nov. 15.—**Doncaster.**—Sewerage.—Settling tanks, percolating filters, humus tanks, sludge lagoons, effluent culvert, roads, etc., for C.B. F. Oscar Kirby, B.E. Dep. £5 5s.

Nov. 16.—**Portrane.**—Tank.—Construction of new 6-in. and 9-in. drains, tank, and other works incidental to the drainage of the farmyard of Portrane Mental Hospital, Donabate, Co. Dublin, for Grangegorman Mental Hospital Committee. P. H. McCarthy, 26, Lower Leeson-st., Dublin.

Nov. 21.—**Hornsey.**—Reservoir.—Covered service reservoir in mass and reinforced concrete at Bishops Wood, for M.W.B. G. F. Stringer, C., 173, Rosebery-av., E.C.1. Dep. £10.

Nov. 24.—**Johannesburg.**—Bridgework.—Structural bridgework, for Vet River bridge, Schoon Spruit bridge, for South African Railways and Harbours, Department of Overseas Trade, 35, Old Queen-st., S.W.1. (Ref. A.X. 5298.)

Feb. 21, 1928.—**New Zealand.**—Deviation.—Construction of Wellington-Tawa flat deviation, Wellington-New Plymouth Railway, for Public Works Dept., Wellington. Commissioner for New Zealand, 415, Strand, London, W.C.2.

ROAD, SEWERAGE, AND WATER WORKS.

Oct. 31.—**Llandilo-Fawr.**—Pipes.—Laying down 12-in. and 9-in. cast-iron and stoneware pipes, together with 6-in. and 4-in. stoneware pipe house connections, from sewer to boundaries of private properties, with manholes and other contingent works in Station-rd., Brynamman, for R.D.C. J. Owen Parry, E., Arcade-chambers, Ammanford. Dep. £3 3s.

Oct. 31.—**Quarry Bank.**—Roads.—Also footways on Lower High-st. housing estate, for U.D.C. A. Homfray, clerk, Council Offices, Stevens Park.

Oct. 31.—**Skegness.**—Sewer.—Surface water sewer at Algitha-rd., and road works at Algitha and Ida-rds., for U.D.C. S. Dep. £1.

Nov. 1.—**Dudley.**—Drainage.—Laying new drains to connect existing drainage systems of Dudley Poor Law institution and of "Rosemary Ednam" maternity and nurses' home, with public services in Bagley's-lane, Sedgley, for B.G. Paine and Hobday, architects, 2, Millbank House, Wood-st., Westminster, S.W.1. Dep. £1 1s.

Nov. 1.—**Dun Laoghaire.**—Mains.—Laying new water mains and other works incidental thereto at Sallynoggin, Glenageary and Sandycove, for U.D.C. F. Webb, Town Surveyor. Dep. £1 1s.

Nov. 1.—**Frinton-on-Sea.**—Improvement.—In connection with improvement of Town Yard, for U.D.C. P. O. Macdonald, C.

Nov. 2.—**Haywards Heath.**—Improvements.—Surface water sewering, forming, levelling, kerbing, tarpaving, metalling and making good a certain road known as Gordon-rd., for U.D.C. G. Plummer, S.

Nov. 2.—**Knottingley.**—Maining.—Of Ferrybridge-lane, for U.D.C. C. R. J. Connors, E. and S. Dep. £5.

Nov. 2.—**Leyburn.**—Drainage.—For (1) In Newton-le-Willows Village: (a) taking up approximately 100 lin. yds. of old drain and relaying with 15 in. concrete pipes; (b) remaking side walk over same, in Bellerby Village; (2) excavating for and laying a double concrete invert culvert, approx. 15 yds. in length; (3) On Bellerby Moor-rd., taking out drain and relaying with concrete inverts, for R.D.C. P. Utley, S.

Nov. 2.—**Mansfield.**—Sewers.—New roads and the laying of sewers on site situate on Ravensdale estate, Sandy-lane, for T.C. W. Thompson, B.E. and S., Market-st. Dep. £2 2s.

Nov. 3.—**Southend-on-Sea.**—Making-up.—of Ambleside-drive (section 3), Park-lane (section 1) and Corsham-rd., and incidental works in connection thereto, for C.B. Robert H. Dyer, B.E. and S. Dep. £1 1s.

Nov. 3.—**Wanstead.**—Making-up.—Draycot-rd., for U.D.C. E. and S.

Nov. 4.—**Egham.**—Roads.—Two roads on Council's housing site, viz., Mullens-rd., No. 1 and Alexander-road, No. 2, for U.D.C. H. Hartwill, S. Dep. £2 2s.

Nov. 7.—**Birmingham.**—Sewerage.—Construction of about 2,000 yds. of concrete tube and stoneware pipe sewers in Shirley-rd., Acock's Green, from Stratford-rd. to near Pool Farm-rd., and private lands adjoining, for T.C. H. H. Humphries, City E. and S. Dep. £2.

Nov. 8.—**Easington.**—Making-up.—Paradise-lane, Easington Colliery; Knaresborough-rd. (part of), Murton, for R.D.C. R. Urwin Harper, Highway S.

Nov. 9.—**Hendon.**—Sewers.—New roads and surface water sewers at Glebe-rd. housing site, Great Stanmore, comprising about 1,600 yds. super 6 in. reinforced concrete carriageway, 900 yds. super. tarpaved footways, 530 yds. concrete kerb, 400 yds. 12 in. by 9 in. surface water sewers, for R.D.C. H. W. Rackham, E. and S. Dep. £1 1s.

Nov. 9.—**Heston and Isleworth.**—Making-up.—Heathdale-av., Osterley-av., Thornbury-av., for U.D.C.—J. G. Carey, surveyor. Dep. £2 2s.

Nov. 14.—**Glasgow.**—Sewer.—About two miles long, and varying from 6 ft. to 7 ft. in diameter, mostly in tunnel, extending from a point on the main drainage outfall sewer near Shiedhall-rd., to Corkerhill-rd., at a point near the Canal Railway Bridge, on a route via Tweedsmuir-rd., and Cardonald place-rd., for T.C. City E. Dep. £5 5s.

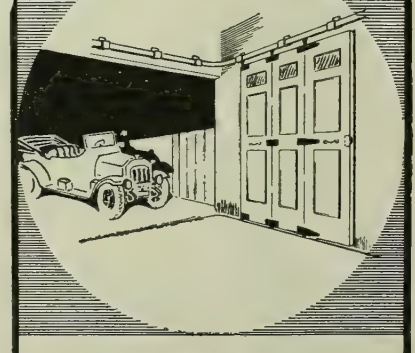
Nov. 15.—**Bushey.**—Making-up.—Of Chiltern-av., for U.D.C.—E. E. Ryder, E. and S. Dep. £2 2s.

Nov. 15.—**Doncaster.**—Sewerage.—Supplying and laying about 2¾ miles of 21-in. diameter and about 1½ miles of 24-in. diameter cast-iron rising and gravitation mains, for C.B. F. Oscar Kirby, B.E. Dep. £5 5s.

Nov. 19.— **Rothwell.** — Paving.—Excavating, granite sett paving, stone walling, surface water drainage, concreting, demolition of buildings, new building, etc., in Leeds and Wakefield main-rd., for U.D.C. J. Southwart, Surveyor. Dep. £1 1s.

Nov. 21. — **Failsworth.** — Making-up. — Sewering, levelling, paving, metalling, flagging, channelling and making-up Claremont-st., Cornwall-st., Hampton-rd. (part of), Harold-st., and Heywood-st., together with certain adjacent passages, for U.D.C. J. W. E. Brown, S.

Nov. 21.—**London.**—Mains.—Laying and jointing of following cast-iron mains, together with connections and contingent works:—6,220 lin. yds. of 20-in. diameter main in Cambridge-rd., from Hoe-lane to Brookfield-lane; 400 lin. yds. of 14-in. diameter main in Brookfield-lane, from Cambridge-rd. to Board's Pumping Station; 600 lin. yds. of 12-in. diameter main in Brookfield-lane, from the Board's Pumping Station to Longfield-lane, for M.W.B. G. F. Stringer, C., 173, Rosebery-av., E.C.1. Dep. £10.



Nov. 21.—**London.**—Main.—Laying and jointing of approximately 5,960 ln. yds., of 24 in. diameter cast-iron main, together with connections and contingent works, from Woodside-av., Fortis Green, Hornsey, to Durnsferd-rd., Wood Green, and from Chase-rd., to the Board's reservoir at Southgate, for M.W.B. G. F. Stringer, C., 173, Rosebery-av., E.C.1. Dep. £10.

Nov. 22. — **Scarborough.** — Reconstruction. — Of Seamer-rd.; for T.C. H. W. Smith, B.E., Town Hall, Scarborough. Dep. £2 2s.

Nov. 30.—**Rochester.**—Sewerage.—Laying of cast-iron syphon and pumping mains, for T.C. W. Law, City E. and S. Dep. £1 1s.

——.—**Coatbridge.**—Road.—Bottoming and bituminous surfacing about 3,000 sq. yds., and paving with whin setts about 2,000 sq. yds., for T.C. B.S.

——.—**Thirsk.**—Repairs.—To 1½ miles of road on estate near Thirsk. W. Watson, surveyor, Market place, Northallerton.

Competitions.

(*See Competition News, p.* 646.)

Auction Sales, Tenders, etc.

* Oct. 27.—**Holloway.**—Joseph Hibbard and Sons will sell without reserve upon the premises, Marlborough Works, Marlborough-rd., Upper Holloway, N.7, stock of a timber and builder's merchant. Auctioneers, 15, Newington Green, Islington, London, N.16.

Nov. 3.—**London.**—J. T. Skelding & Co., will sell without reserve, by order of Mr. S. A. I. Shipton (who is relinquishing the business owing to ill-health) at Nailsworth Works, No. 278, Albany-rd., Camberwell, S.E.5. The whole of the stock and plant of a builder and decorator. Auctioneers, 48, Gresham-st., Guildhall, E.C.2.

Nov. 8.—**London.**—Joseph Hibbard & Sons will sell by order of the Liquidator, C. H. Bull, F.C.A., re C. B. N. Snewin, Ltd. (in voluntary liquidation) at the Wharf, Berkshire-rd., Hackney Wick, well-seasoned hardwoods in logs, planks and boards; the lease of the wharf will be offered for sale prior to sale of stock; freehold building site of 20,000 sq. ft. at Back Hill, E.C., will be offered for sale at a later date. Auctioneers, 13, Newington Green, Islington, N.16.

* Nov. 9.—**London.**—Hooker and Rogers will sell on the site, 64, Streatham Hill, S.W., building materials, stock bricks, etc. Auctioneers, 4, High-st., Croydon.

* Nov. 10.—**London.**—J. T. Skelding and Co., F.A.I., will sell by order of Messrs. Wm. Daley and Co., owing to the rapid development of the Ealing Common estate and the necessary demolition of part of their temporary estate workshops for further development on site, Tring-av., Ealing Common, W., up-to-date and complete woodworking machinery, principally by J. Sagar and Co., Ltd., together with the surplus builders' and contractors' plant and machinery and effects. Auctioneers, 48, Gresham-st., Guildhall, E.C.2.

* Nov. 29.—Messrs. Hampton and Sons will sell three building sites at Amersham Common, Berks. Full particulars from Hampton and Sons, 20, St. James's-sq., S.W.1.

Public Appointments.

Oct. 31.—**Middlesex.**—Clerk of Works for housing scheme required by the Enfield U.D.C. Engineer and Surveyor, Public Offices, Enfield, Middlesex, upon receipt of stamped addressed envelope.

Oct. 31.—**South Africa.**—Lecturer in Furniture Trades, Grade I, required in the Technical College, East London, South Africa. The Secretary, Office of the High Commissioner for the Union of South Africa, South Africa House, Trafalgar-sq., W.C.2.

Oct. 31.—**South Africa.**—Lecturer in Building Trades, Grade II, required in the Technical College, East London, South Africa. Office of the High Commissioner for the Union of South Africa, South Africa House, Trafalgar-sq., W.C.2.

Nov. 1.—**Brighton.**—Temporary Architectural Assistant required by the Brighton B.C. D. Edwards, M.Inst.C.E., F.S.I., B.E. and S., Town Hall, Brighton, endorsed "Assistant."

* Nov. 2.—**Oxford.**—Clerk of Works in connection with the erection of about 312 houses on the Gipsy-lane housing site required by the C.C. J. F. Richardson, C.E., Town Hall, Oxford, endorsed "Clerk of Works."

Nov. 5.—**Leicester.**—Chief Architectural Assistant in the Housing Dept., required by the City Council of Leicester. J. S. Fyfe, Housing Architect, Wyggeston House, 18, Highcross-st., Leicester.

Nov. 7.—**Sunderland.**—Assistant School Architect required by the Sunderland Education Committee for the proposed new elementary schools, Newcastle-rd. Herbert Reed, Chief Education Officer, Education Offices, 15, John-st., Sunderland.

* Nov. 8.—**Watford.**—Clerk of Works required in connection with the erection of a public library at Hampstead-rd., Watford, for the Corporation. W. W. Newman, Esq., A.M.I.C.E., F.S.I., B.E., Municipal Offices, Watford, endorsed "Clerk of Works."

* Nov. 10.—**Dover.**—Town Planning Assistant required by the Dover B.C. Wm. Boulton Smith, B.E., Maison Dieu House, Dover.

Nov. 14.—**Leeds.**—Head of Building Department required at the Leeds Technical College. James Graham, Ph.D., Director of Education, Education Offices, Leeds.

No Date.—**London.**—Teacher of Builders Quantities, Teacher of advanced book-keeping and costing, for evenings. Clerk to the Governors, Northern Polytechnic, Holloway, London, N.7.

* No Date.—**Kenya.**—Carpentry Instructor required by the Government of Kenya for the Pensions Dept. for a tour of 30 months' service with prospect of extension. Crown Agents for the Colonies, 4, Millbank, Westminster, London, S.W.1, quoting M/48

* No date.—**Tanganyika.**—Draughtsman required by the Government of the Tanganyika Territory for the Public Works Dept. for a tour of 20 to 30 months' service with possible extension. Crown Agents for the Colonies, 4, Millbank, Westminster, S.W.1, quoting M/214.

Institute of Builders.

Following is a list of the successful candidates in the 1927 Associate Diploma Examination:—Mr. A. Birch, York; Mr. E. Bonsall, Chesterfield; Mr. C. H. Bowyer, Slough; Mr. W. E. Ismay, London; Mr. H. A. Maxfield, Waltham Cross; Mr. P. Sims, Plymouth.

THE INVENTIONS EXHIBITION

The International Exhibition of Inventions, recently held at the Central Hall, Westminster, included a number of exhibits of interest to the building industry, many of which have not yet been placed on the market. Among these we noticed the "Joey" gas boiler, which received the second highest prize of a silver medal. This boiler, invented by Mr. F. J. Connor, is designed primarily for heating water in bulk for domestic purposes, and could be fitted with little trouble to existing hot-water systems in houses where a gas supply is available. The essential features of the design are a spiral flue and an overhung crown, both of which are conducive to effective interchange of heat between the products of combustion and the water in the boiler. The boiler is stoutly constructed of ⅛ in. mild steel plate and is of neat appearance. Its over-all height (exclusive of the height of the three legs, which can be whatever the particular situation requires) is approximately 3 ft., and its diameter is 1 ft. 3 in.

A device for improving water-heating in domestic ranges (Mr. Thomas Thompson, patentee) was of interest. It consists of a flame deflector, the flames from the fire space, after traversing the tunnel under the boiler, to be projected against the back heating surface of the boiler, instead of following the "pull" of the draught, and striking against the back face of the chimney flue, where they become dissipated and their value lost. The heat units in the flames are thus trapped and driven into the boiler with very effective results. The water in the cylinder is kept at a high temperature all day long, with the boiler damper only slightly open.

Another interesting heating exhibit was the Corthesy fire, which consumes its own smoke by the agency of a gas jet. The smoke is led to the gas, causing the formation of a mixture of the two elements. This addition of gas to the smoke changes the property of the latter, viz., its state of incombustibility into that of combustibility. Thus this mixture will burn as a gas—a gas equivalent to a poor gas, which burns completely without difficulty. The device can be fitted to existing grates.

The "Infallible" chimney-pot (the patent of Mr. G. H. J. Ketcher) was another exhibit of practical utility. It consists of a one-piece inner shaft with 1 in. air tubes fitted thereto. An outer cylindrical casing is secured to the sides of the inner portion by deflectors and is surmounted by four louvres. The deflectors extend only to about one-half of the circumference, leaving the other half of the space between the inner and the outer pot open at the lower end for the escape of smoke and down-draught. The pot is made in reinforced cement, with copper-wire in louvres.

A system of storing and parking motor-cars, patented by Mr. W. R. Field, was shown by a model. It may be briefly described as follows:—A building is erected containing hundreds of lock-up cubicles, or parking stalls, built on several floors, and arranged in serried rows at an angle to the roads or thoroughfares, so formed between them, of about 130 deg. Each cubicle is provided with a door at either end, one for entrance and the other for departure. A pair of "U"-shaped ramps, built from the street, and connecting each floor, are used, one for incoming traffic, the other for outgoing. Upon arriving at a floor, cars proceed in a one-way direction along the roads and enter their allotted cubicles, or parking stalls, on their right, and when leaving again do so from their left, and continue, always in the same one-way direction, to the departure ramp.

Numerous details of building equipment of an improved order were on view in the Building and Housing section of the exhibition, but we have no space to refer to them in detail.

NEW BUILDINGS IN LONDON

Bayswater.—Extensions.—The extensions to Patrickson's Hotel have been entrusted to Messrs. G. H. Carter, Ltd., of Clissold Works, 57-69, Green-lanes, N.16, under the supervision of the architects, Messrs. Harriss, 58, Theobald's-road, W.C.1.

Becontree.—School.—The London County Council recommend that, subject to the consent of the Minister of Health, a site on the Valence (No. 10) section of Becontree, having an area of about 3.21 acres, with a frontage of about 250 ft. to Lymington-road, be sold to the Essex Education Committee for the erection of an elementary school.

Berners-street.—Reconstruction.—In connection with the reconstruction and the erection of the new west wing of Middlesex Hospital, Berners-street, W.1, the contract has been given to Messrs. Holland and Hannan and Cubitts, Ltd., of Gray's Inn-road, W.C.1. The tender price is £241,511.

Charlton.—School.—Tenders are now being invited for the erection of a new elementary school adjoining the Catholic Church, Charlton-road, S.E., for the School Committee. Mr. F. A. Walters, 28, Great Ormond-street, W.C.1, is the architect.

Croydon.—School.—A new school to accommodate 400 children is to be built for the Croydon Council. Mr. W. H. Ashford, A.R.I.B.A., of 32, Paradise-street, Birmingham, is the architect, and the building contract has been entrusted to Messrs. Truett & Steel, Ltd., High-street, Thornton Heath. The work is to cost £17,247.

Deptford.—Rebuilding.—Mr. W. D. Key, A.R.I.B.A., of 4, Palmer-street, S.W.1, is the architect for the rebuilding of 71, High-street, Deptford

Grosvenor-street. — Rebuilding. — Messrs. G. H. Carter, Ltd., of Clissold Works, 57-69, Green-lanes, London, N.16, are to carry out the rebuilding of 8, Upper Grosvenor-street, W.1, under the supervision of the architects, Messrs. Forbes & Tate, FF.R.I.B.A., 97, Jermyn-street, S.W.1.

Hackney. — Adaptation. — The London County Council has accepted a tender at £11,997 for adaptation of premises on Upton House site, Hackney, for a central school. Messrs. Marrable Bros., 60, Pretoria-road, Levtonstone, E.11, have secured the contract.

Hammersmith.—School.—A new school is to be erected on the Lena-gardens site, Hammersmith, for the London County Council, and Messrs. Gaze's, Kingston-on-Thames, have secured the contract at £19,663.

Lewisham.—Houses.—A further 97 houses are to be built by the London County Council. Plans have been passed by the Lewisham B.C.

Merton.—Houses.—A start is shortly to be made on the formation of a new housing estate to be known as "St. Helier's." The scheme provides for 9.000 houses, and will cost £100,000, and is for the London County Council.

North Kensington.—School. — Kensington Council has received a notice from the London County Council of an application made to them for permission to erect a new Jewish school on the sites of Nos. 111-117, Lancaster-road, and they have approved the application.

Paddington. — Baths. — The Paddington Borough Council are proposing, subject to the approval of the Ministry of Health and of the London County Council, to establish a Turkish and Russian bath in the south-east portion of the new buildings in Porchester-road, at an estimated cost of £16,462.

Purley.—Fire Station. — Messrs. G. H. Gibson, Ltd., of Croydon, have secured the contract for the new fire station. Messrs. Young & Co., 6, Queen Anne's-gate, Westminster, are supplying the constructional steelwork. The architects are Messrs. Nicholls & Hughes, AA.R.I.B.A., of Verulam Buildings, Gray's Inn, W.C.

South Bermondsey. — Station. — The Southern Railway Co. have decided to close South Bermondsey Station, and to construct a new station on land adjoining Zampa-road.

PROPOSED NEW BUILDINGS & OTHER WORKS*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

FOLLOWING is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

ALTRINCHAM.—The U.D.C. have requested Mr. H. M. Brown to prepare a scheme for 34 flats at Beaconsfield-rd.

ANNFIELD PLAIN.—Plans approved by U.D.C. Alterations to Wesleyan church.

ATHERSTONE.—Surveyor to Council is to submit a lay-out and plans for 70 houses on Westwood-rd. site for occupation of tenants who will be dispossessed under Atherstone slum clearance scheme.

ATHLONE.—Council is to proceed with new housing scheme and build 30 dwellings.

BARKING TOWN.—U.D.C. approved Engineer's plan and estimate of £1,400 for the culverting in reinforced concrete of the watercourse on the Western boundary of the Eastbury estate.—Plans passed: 73 houses, Lyndhurst-gdns. for J. R. Leftley; showroom, office and flat in St. Pauls-rd., for Morrall & Whitehouse; 16 houses and 4 garages in Lyndhurst-gdns. for H. Samborough.

YORKSHIRE.—We understand that Messrs. Redpath Brown & Co. have received a contract for construction of a mill for J. & P. Coats, Ltd., in Yorkshire.

YOUGHAL.—South Cork County Board of Public Assistance proposes to spend £800 on new hospital.

Building Trade Conditions for September.

Employment declined during September; continued good, however, in many districts with skilled operatives other than painters but was poor or slack at some centres, including Keighley, Macclesfield, Lancaster, and Preston; it was moderate, on the whole, with unskilled workers. According to the *Ministry of Labour Gazette*, bad weather conditions hampered outside work and caused an appreciable amount of lost time; on the other hand, a little overtime was reported from a few districts. Employment, as a whole, was only slightly better than in September, 1926, when it was adversely affected by a shortage of materials arising out of the stoppage in the coal-mining industry. As regards individual occupations, employment showed some decline with plasterers, but was very good or good in most districts, some shortage being reported from several centres; it also declined with bricklayers, masons, carpenters, and slaters, but was either fairly good or good with such workers at most centres; it showed a further slight improvement with plumbers and was generally fairly good. Employment showed a seasonal decline with painters, but was fair, on the whole, with skilled men; it remained moderate with tradesmen's labourers.

HOUSING PROGRESS IN SCOTLAND

The following figures show the progress that has been made in State-aided housing schemes in Scotland to September 30, 1927 :—

	Completed.	Under Construction.
1919 Act	25,542	8
Private subsidy schemes (1919 Additional Powers Act)	2,324	—
Slum clearance schemes ...	5,946	3,257
1923 Act :—		
By local authorities ...	3,778	227
By private enterprise ...	10,903	2,574
1924 Act :—		
By local authorities ...	13,832	12,445
By private enterprise ...	313	187
Demonstration houses ...	17	—
Steel houses erected on behalf of Government by Scottish National Housing Company	1,916	556
	64,571	19,254

The Scottish Housing Record.

A review of the building activities in Glasgow during the past eight years has been issued by the Housing Department of the Corporation. During that period the number of houses dealt with has amounted to 27,419. In 1920 the capital expenditure was £199,540, and for the year ending on May 31 last it was £2,003,123.

OBITUARY.

The death has occurred at 6, Ivy-place, Berwick, of Mr. Peter Whittlie, builder. Mr. Whittlie was in his 76th year.

The death also occurred of Mr. Archibald M'Arthur, aged 52, joiner and builder, at Campbell-place, Inverskip.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Dunfermline.—Improvements.—The Carnegie Dunfermline Trustees have received permission by the Dean of Guild Court to demolish a shop and house at the junction of Chalmers-street with Bridge-street, and to erect wrought iron railings and stone pillars at the entrance there to Pittencrieff Park and Glen. The scheme is estimated to cost about £30,000.

Edinburgh.—Gas Holder.—The Gas Committee of Edinburgh Town Council has recommended that a new gasholder at Granton Gasworks be purchased at a probable cost of £120,000 to £150,000.

Edinburgh. — Houses. — The Edinburgh Dean of Guild Court has sanctioned the following :—Messrs. E. Chalmers & Co., Ltd.—warehouse at Ashley-place, Newhaven-road, Leith; and Mr. G. Andrews—three shops and two houses at Liberton-gardens, Liberton.

Glasgow.—Houses.—The Western Heritable Investment Co., Ltd., propose to erect 712 houses at Meikle Aikenhead.

Glasgow.—Hospital.—The Lord Provost of Glasgow has held a meeting in support of the scheme for building an adequate dental hospital and school in Glasgow.

Glasgow.—Housing.—The Glasgow Dean of Guild Court has granted sanction to the Corporation for 1,142 three-apartment, 522 four-apartment, and 14 five-apartment houses at Carntyne, the cost of which, it is estimated, will amount to £945,483. They were also granted warrants for 144 houses of three apartments and 48 of four apartments at Balmore-road and 8 houses of three apartments at Shettleston. The Corporation were also granted permission to erect shops at Hawthorn-street and Chestnut-street and to construct roads and sewers at Garscadden-street, Knightswood, at Carntyne, and at Ruchill. Other linings granted by the Court were :—Royal Infirmary—to erect cloakrooms and workshops; Messrs. Lauder & Shaw, 341, Bath-street—bungalows at Paisley-road and Crookston-road; Messrs. James Templet & Co., William-street, Greenhead—buildi at Abercromby-street, Bridgeton; Mess Mactaggart & Mickel, Ltd.—70 houses Meikle Aikenhead.

Nairn.—Harbour.—The Town Council agreed to borrow £26,000 for the construct of the new harbour. The total cost of works is estimated at £47,000.

Portobello.—Pier.—The Electricity Committee of Edinburgh Town Council has gen ally approved the plans submitted by W. A. Macartney, Burgh Engineer, for proposed erection of a pier on the beach Portobello.

Tranent.—Police Station.—Tenders h been submitted to the East Lothian Stand Joint Committee for the erection of a police station at Tranent, and the committ has forwarded them on to the architect his consideration.

Turnberry.—Extension.—The London M land and Scottish Railway Co. are to ca out important extensions at their hotel Turnberry. The cost of the work will about £60,000. The contract has been cured by Messrs. William Taylor & S (Glasgow), Ltd.

Incorporation of Architects in Scotland.

The monthly meeting of the Incorporati of Architects in Scotland was held at Rutland-square, Edinburgh. Applications membership were submitted as follows Two Fellows and one Associate. The coun resolved to grant during session 1927- various prizes—the Sir Rowand Anders medal and prize of £100, to be awarded competitor under the age of 28 years w produces the best design for a Universi Union; the Rutland prize of £50 for study of materials and methods of constr tion; prize of £15 to third-year stude attending architectural school in Scotlan and two prizes of £20 and £5 respective for "quarterly" essay competition, availa to students and members of the Incorporati under 35 years of age.

BUILDING TRADE WAGES IN SCOTLAND.

TRADE NEWS

Second-hand Scientific Instruments.

The October catalogue (No. 91) of Messrs. C. Baker, 244, High Holborn, W.C., contains details of a number of good second-hand scientific instruments which will be of interest to surveyors and others. Several good microscopes are on hand, besides a number of theodolites, levels, etc., every piece being guaranteed to be in order. The firm has also been requested to dispose of the unique collection of scientific and photographic equipment belonging to the late Edward Sanger Shepherd. The catalogues will be sent upon request.

Solid Steel Columns.

A well-got-up booklet, bound in leather, has been issued on this subject by Messrs. Moreland, Hayne & Co., Ltd., of 80, Goswell-road, E.C.1, the constructional steel engineers. The booklet contains some useful reference tables and will be sent upon request to all architects and constructional engineers.

Change of Address.

Messrs. Wm. Wadsworth & Sons, Ltd., of High-street, Bolton, have recently removed their London office to more commodious premises at 72/74, Victoria-street, S.W.1. Their branch manager now is Mr. E. Chaudoir.

Travelling Exhibit of Radiators.

The motor travelling exhibit of the National Radiator Co., Ltd., of Hull, fitted with a working installation of the "Ideal" Cookanheat and "Ideal" Classic radiators, will demonstrate on Friday afternoon, the 28th inst., in the Motor Park, Church-street, Barnsley.

A Guide to the Engineering and Mechanical Industries.

A Classified Guide to Literature relating to the Engineering and Mechanical Industries, published between August, 1926, and September, 1927, has been compiled by Messrs. F. & E. Stoneham, Ltd., 79, Cheapside, E.C.2, for the Annual Conference of the Library Association at Edinburgh. Copies of the Guide can be had, free of charge on application to Messrs. Stoneham.

Directory of the Building Trades.

Messrs. Kelly's Directories, Ltd., have issued the 16th edition (price 50s. net) of their Directory of the Building Trades. This Directory covers, and constitutes an invaluable guide to, the Building and Allied Trades. It embraces England, Scotland and Wales, and the principal towns in Ireland, the Channel Islands and the Isle of Man. In addition to the names of upwards of 20,000 builders, it gives also the names of those engaged in the allied professions and trades, such as builders in concrete, plumbers and glaziers, gasfitters, sanitary engineers, architects, land and estate agents, surveyors, etc., and of manufacturers and suppliers of the different articles and materials used. The book comprises: (1) A places section, giving the names of each county, arranged alphabetically under the towns and villages, also such details as population, early-closing and market days for each place; (2) an alphabetical classification of trades for the London postal district, arranged with the names under each trade heading in alphabetical order; (3) a similar classification of trades for the rest of England, Scotland and Wales. There is also an extensive section giving, in alphabetical order, the names of branded articles and specialities used in the building trades, together with the names and addresses of the manufacturers. This is a publication necessary to architects and constructors, and one which should always be kept in date. It will be found to repay itself many times.

TENDERS

Communications for insertion under this heading should be addressed to "The Editor," and must reach him next week not later than Tuesday evening.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

. CXXXIII. No. 4422. NOVEMBER 4, 1927.

THE JOHN WOOD CELEBRATION AT BATH

A CENTENARY, or bicentenary, is something more than a mere milestone in history if it is worth celebrating at all. It should be a distinct occasion for pause and consideration, and none more so than that just celebrated in Bath to commemorate the two dredth anniversary of the beginning of John Wood's career hat city. There is much we can learn from John Wood, much we can learn from the city of Bath, perhaps the one sistently classic city in a country singularly rich in fine es.

)f recent years town planning has become particularly a tter of concern to architects, local and Parliamentary horities, and the princes of commerce. It is now generally ognised that not only does this science open the gate to nd æsthetic effect, but it is the practical and sensible way dealing with a number of economic subjects. It must be nitted that many are the plans of cities and parts of cities jected, which bid fair, on paper at all events, to solve at e the demands of æsthetics and practice, with an incidence ich is the real solution of all artistic problems. Still, it not yet obvious that we have realised to the full the fact t the fine town plan is but the means of producing the fine n, and that it is not an end in itself. Our street layouts pear to be concerned mainly with the two dimensions of n and too little allied to that third dimension which is the of beauty, and without due consideration of which the st town plan must disappoint in execution.

A striking instance of this deficiency is presented by the Regent Street, where a fine example of street architecture been seriously impaired, if not completely ruined, by a erogeneous assembly of units, some quite meritorious in mselves, and on exactly the same street plan with which sh delighted us. That was not John Wood's way. To n, the fine layout and the fine façade were inseparable parts the same work of art, and the deep satisfaction which we felt s week in the streets of Bath is the direct result of that right itude in which John Wood approached all his problems.

We know very little of his early life, and, though he is believed have been born in Yorkshire, the origin of his fame syn-onises with his career in Bath. Beyond that, we know t he enjoyed some period of education in London before com- to the city of his adoption, it is believed through the influence his patron, Ralph Allen. What form this education took, to whom he looked up as primarily his master is not known, the diligence of his studies and the wise direction he must e received are proved by the mature taste which he applied his earliest works, while still in his twenties.

His activities seem to have found an immediate outlet, and a very diverse nature, for he combined the parts of architect l contractor on practically all his works, besides undertaking h the utmost efficiency such an intricate engineering task the construction of the Bath-Bristol canal. As contractor imported men and plant from various parts of the country, l is said to have revolutionised local building methods, and can tell from his writings how deep was his understanding building method. John Wood knew his job, and with the ndless activities of this man in mind, and making due allowance for the increased knowledge required by the modern architect, let the architect of to-day think twice before he delegates to the specialist much that should be his personal concern. Wood's Essay on Bath stamps him as a writer of no mean literary ability, and truly many pages could be written upon the activities of this versatile genius, before mention has been made of his outstanding qualities as an architect.

At the time of Wood's arrival in Bath, the city had already become a fashionable resort. Royal visits, and the prescription of the Bath waters by a King's physician, had left their permanent mark upon this once retired mediæval town. From this it was in process of transformation into a Renaissance character, redolent of the taste of a cultured fashion. The sash window of the future struggled kindly with the gables of the past in interesting transition. To John Wood fell the task not only of infusing the pure classic tradition, but of applying the classic discipline to layout as to composition. Of how well he fulfilled this task, Queen Square, the Circus, and Gay Street, parts of which were carried out by the younger Wood as a worthy successor, and all of which are done in the best classic manner, translated in national terms, are proof enough. And while this class of urban work is most often associated with his name, such a work as Prior Park shows his complete equipment as an architect in studied treatment of a single theme, set in the broad lines of a spacious and harmonious layout.

John Wood was perhaps fortunate in his opportunities, and in his patrons, but whereas all but the few allow fortune to pass unnoticed, he grasped it with both hands, and applying to it care, wise direction, shrewdness, and perhaps not a little arrogance, if we are to go by his judgment of not unworthy contemporaries, he made for himself a place among the masters of the English Renaissance.

Mr. Mowbray Green, the well-known authority on the architectural history of Bath, whose active presence at the John Wood celebration was a great factor in its success, tells us that there is no record of Wood having travelled abroad for the purpose of study. It would be fruitless to speculate upon whether the truly "English" character of his work would have suffered from the distractions of foreign travel, or whether its classic character would have found some new inspiration therefrom, or if both results had followed, where the balance would have been struck. We prefer to regret no part of this great architect's development, but to feel that circumstances conspired to lead his steps where his genius could find the fullest outlet.

If any speculation should follow this train of thought it is surely rather concerned in that ignorance of Bath architecture which one so often meets among students who have seized the first opportunity to leave the country for the purposes of study. To them we might with reason echo the astonishment with which Mr. Cyrus Bantem met Mr. Pickwick's confession: "Never in Ba-ath, Mr. Pickwick?" If this Celebration has done no more than draw attention to a well of study, from which every English student should drink deep, as an essential part of his education, it will have played its part. For ourselves, we frankly admit we are refreshed at this renewal of acquaintance with an old friend.

NOTES

The John Wood Celebration.

IN connection with the Wood celebration at Bath, there was issued a little pamphlet entitled "John Wood, the architect of 18th Century Bath." It is written by Councillor T. Sturge Cotterell, and has an excellent foreword by Mr. Walter Tapper, President of the R.I.B.A. The things which helped Wood in his career and the various stepping-stones to his success are well brought out by Mr. Cotterell. This is a very readable and interesting pamphlet. As Mr. Cotterell points out, there is no memorial to Wood and his son except the city itself, and we venture to suggest a Wood Lectureship might be founded by the local architectural society as a useful memorial.

Reactionary Art Criticism.

IN the urgent need there is to-day for a more vital art in the Churches, it is somewhat disappointing to find an art critic in a much read contemporary announcing as a piece of impertinence that an artist in approaching his subjects should seek his own interpretation instead of following "the conventional treatment." But what is the conventional treatment which requires from the artist this conformity? When religious art in the doctrinal sense dominated interpretation, there was in succeeding ages wide variation of treatment; who, then, is to say to which convention of tradition or to what particular period the artist is now to subject himself, or why he is impertinent in presenting his own creative interpretation? William Blake presented the Crucifixion scene by a view from the back of the crosses, of deeply impressive character. We are told that Mr. Eric Gill is to be praised, in speaking of his Altar Piece for Rossall School "in nothing more highly than for following the conventional treatment." But there are so many and each period has had its own! We are not here concerned to discuss Mr. Gill's always interesting art, but to challenge a statement which would leave art tongue-tied by authority, a otherwise by conventions of old man very detrimental to the freedom of art

An Old Bath Doorway in Chapel Court

Tradition and Convention.

THE fallacy of such a view still further exposed when properly distinguish betwe the unconscious and salut influence of tradition on good artists' work and the lapsing i earlier conventions of manner, which these conformities are required, ren Michael Angelo and Titian both guilty the same "impertinence" for adopting the "conventional tre ment" of an earlier period. cannot, it is true, begin again. We herit from the moment our eyes open the world, and the impressions we rece from the best examples necessarily a inevitably colour what we do as artis In such a sense there is nothing who original. But this is another mat altogether to emulating old conventio and concentrating only on the shuffli about of older habits of design. It is t middle course between the one and t other that is included in the best a though the artist produces best wh freest from influences, past or conte porary, and when experience is tra cended by inspiration. The tendency reaction to-day, to lose faith in ourselv is to be guarded against, for if it were impose its dangerous tyranny on us, would dam the springs of new endeavo and enclose art in a sort of "faith o delivered" in which the human spi ceases to grow.

A Bishop on Architecture.

IN a publication recen issued, "The See of Derby a souvenir of its foundati there is contained a messa from the Bishop of Southw (which we print on another page) c taining much that will be of interest a time when the size of a building and amount of its cost has contracted sense of values to computations of m size and expenditure. In this connect a correspondent writes: "I hear suggested that no architect would c to take quite the amount of risk invol in such a working co-partnership architect and craftsmen. Yet in the p sence of such modern buildings as h

Rome Scholarship in Sculpture, 1927 : Group for a Gateway to a Civil Aerodrome.
By MR. HAROLD W. PARKER (Royal College of Art.)

ecluded this relationship, we see such verty of treatment, an architecture ithout craftsmanship that a nearer approximation to the ideal of the Bishop sorely needed. And is it not a welcome gn of the times that a bishop in his essage to the new diocese should urge e need of an advance on one-man chitecture and its more contracted interpretations ? "

The Protection of Stonehenge.

A further appeal for the protection of this ancient national heirloom has been issued by the Stonehenge Protection Committee—composed of the Premier, Mr. Stanley Baldwin; the Lords Crawford and Grey, and Mr. Lionel Earle — from which we learn that 400 acres of the moor surrounding Stonehenge have been purchased and vested in the National Trust, thus preventing any possible building development within the view. There yet remain to be purchased, however, some 1,200 acres to the south and west of Stonehenge, including a long strip along the main road, which is in constant danger from the erection of houses, cafés, petrol pumps, garages, etc., and we understand that a further £25,000 is yet required. While we do not doubt that this sum—if necessary if the charm and value of Stonehenge as a national possession is not to be lost—would eventually be forthcoming, there is but a short option for the land, and it is imperative that help should be both speedy and generous. Contributions may be sent to the Secretary of the National Trust, 7, Buckingham Palace Gardens, S.W.1.

Countryside Desecration.

The average man would doubtless be very sceptical as to the necessity for motorists to run through the Pass of Glencoe at forty miles an hour or more. To change the winding road down the Pass of Glencoe into a straight racing track sounds to many amongst us as a desecration of one of our most valued possessions. The *Times* view of the pass, published last week, illustrates in an easy and graphic manner what iconoclastic changes the motoring craze might bring about. For those to whom speed is everything and provides a sort of fierce delight, should not a benevolent government provide racing spaces in various parts of the country where this form of activity could be practised with no risk to anyone but the speed devotees themselves? The public should be protected from this form of pleasure which would turn our thoroughfares into avenues of great danger and gradually destroy so much of the beauty of our countryside.

Dogs and Councils.

The recent animated discussion at the Rathmines Local Council in Dublin, as to whether a certain residential district was suitable for the site of a new greyhound course, proved to be of unusual interest. The vast majority of inhabitants appear to deplore the scheme, but Counsel's opinion made it clear that Ireland, which enjoys neither the limitations nor privileges of the 1923 Town Planning Act—with its prohibitory clauses concerning amenities—is defenceless in such a predicament. The only authority left to the Council was to approve or disapprove the actual plans. Is it possible that approval could be deferred long enough to allow of legislation being passed in the interval ? Such a limitation of power must obviously be impossible in any country which intends to take its town development at all seriously.

Links with the Past.

Mr. Thomas MacLaren has just paid a visit to England after a long sojourn in Colorado which seems to have averted a serious danger to his health, and he is continuing his practice at Colorado Springs. He was Pugin student in 1887, and in reference to his present visit to England, Mr. Chas. Henman writes that he himself was Pugin student in 1868, and became an Associate in 1866, whilst he remembers his late father saying he had attended a meeting of architects at which it was proposed to found the Institute. This note on the Pugin prizemen thus discloses a living link with a past when there was no Institute.

Bath.

GENERAL NEWS

Two New A.R.A.'s.

At a General Assembly of Academicians and Associates held on Tuesday, Mr. Francis Dodd, painter, and Mrs. Laura Knight, painter, were elected Associates of the Royal Academy.

The Baths of Bath.

The ex-Mayor of Bath (Mr. C. H. Hacker) reopened on Saturday the Old Royal Bath in Hot Bath-street, which has been adapted to modern needs with the most up-to-date aids in the specialised treatment of cripples. The outward appearance of the building, which was planned by John Wood, has been preserved.

Crane Smash in Southampton-row.

During the gale that swept the country on Friday night last, the wind blew over a great crane on a tripod staging of steel and timber, which was being used in the construction of Victoria House, the new head offices of the Liverpool Victoria Friendly and Approved Societies in Southampton-row.

French Distinction for Sir John Simpson.

Sir John Simpson has been unanimously elected "Membre d'Honneur" of the Société Historique des VIIe et XVe Arrondissements de Paris, a distinction conferred only once previously since the foundation of the society in 1905. Sir John is already a member of the society, as well as of several other French architectural organisations.

Protection of Shop Windows.

In view of the recent disaster in Bethnal Green Road, when a number of children were forced by the pressure of a crowd behind them through a plate-glass shop window, whence they emerged cut and bleeding, and were taken to hospital, one of our correspondents offers the suggestion that a light metal grille of open pattern, if fixed in front of a shop window, a few inches in advance of the glass and extending to about four feet above the footway, would prevent the recurrence of such accidents. This is a point that architects will probably consider.

Honours for Surveyors.

The ballot to fill the vacancy on the Council of the Surveyors' Institution, caused by the resignation of Sir Charles Howell Thomas, on appointment as Permanent Secretary, Ministry of Agriculture and Fisheries, has resulted in the election of Mr. C. H. Gott, chief valuer to the Board of Inland Revenue, as one of the sectional representatives of surveyors in the Government service, and of Mr. J. Silcock (Leeds), as a representative of the Yorkshire County branch. These positions were previously held by Sir Charles Howell Thomas and Mr. Gott respectively.

Opening of the Woolwich Memorial Hospital.

The Duke and Duchess of York opened the Woolwich Memorial Hospital at Shooter's Hill on Wednesday. We published illustrations of the building, from the designs of the architects, Messrs. Pite, Son & Fairweather, in our issue for March 11, 1927. On Thursday, H.R.H. Princess Mary, Viscountess Lascelles, opened the Woodlands Nurses' Home in connection with the Greenwich and Deptford Hospital, Vanbrugh Hill, Greenwich, the architects for which are Messrs. Pite, Son & Fairweather. The Woodlands Nursing Home was illustrated in our issue for July 23, 1926.

Mr. C. F. A. Voysey.

In connection with the dinner which is being given to Mr. C. F. A. Voysey by the R.I.B.A. Council on November 17th, an architect familiar with his work has written a note, in the course of which he says: "In honouring Mr. Voysey the Institute does honour to itself; for the same independence of thought which has placed all architects—whether they know it or not—in his debt, has led Mr. Voysey to stand apart from the Institute, of which he has never been a member. . . At thirty he was in active practice as a prolific designer of houses and their accessories, and the work of those early days is as emphatic in its identity as any he has done since or is doing now. . . Since those days the ideas presented by Mr. Voysey have been absorbed by designers; many of his devices are now commonplaces of modern house architecture, and the principles he then inculcated are established in the angle from which the practising architect of to-day approaches his work. Thus it is that a new generation is imperfectly aware of what architecture owes to the genius of C. F. A. Voysey."

ITALIAN GOTHIC ARCHITECTURE.

SIR BANISTER FLETCHER, F.S.A., F.R.I.B.A., lecturing on Wednesday last at the Central School of Arts and Crafts on the architecture of Italy, referred to the Gothic period. Here, he said, were many and diverse influences in art at the beginning of the mediæval period. The Classical remains in that country preserved the Roman tradition in design, and the Gothic style never took root there, except at Milan and other places in the north, where German influence was sometimes apparent. Again, Eastern influence via the Mediterranean Sea produced a Byzantine element. This resulted in a dual treatment, a quaint mingling of Gothic pinnacles and classic entablatures, which was the outstanding feature of Italian Gothic. The independence of the powerful Republics of Venice, Genoa, and Florence, the power of the Duchy of Milan, and the rivalry of the free cities of the hills and the plains, all militated against any Italian unity, whether in art or policy. The lecturer described the charm of churches in which the dual treatment produced a result which, though not homogeneous, was harmonious, and also described St. Petronio, Bologna, with its interesting unfinished front; SS. Giovanni e Paolo, Venice, a simple Northern interpretation of Gothic, with its internal tie-beams in lieu of buttresses to resist outward thrust; the Certosa, or church of the Carthusian monastery, at Pavia, with its remarkable Renaissance façade; and lastly, that more typically Gothic and impressive Cathedral at Milan, described by Tennyson as "A mount of marble, a hundred spires."

The lecture on Wednesday, November 9, will deal with the Gothic monuments of the more southern parts of Italy, commencing at 6 o'clock.

Coty House: Staff Entrance from Marylebone Lane.

MR. H. P. CART DE LAFONTAINE, A.R.I.B.A., Architect.

COMPETITION NEWS

George Watson's Boys' College.

Mr. John Keppie, F.R.I.B.A., of Glasgow has been appointed assessor in this competition.

Wesleyan Church, West Smethwick.

The assessor in this competition, Mr. W. H. Bidlake, M.A., has awarded first place to the design of Messrs. Webb and Gray, of Dudley and Stourbridge.

Town Hall Extension, Lewisham.

The development of the Lewisham Town Hall extension site is to be the subject of an open competition, and Mr. F. Winton Newman, F.R.I.B.A., is, we understand, to be appointed assessor.

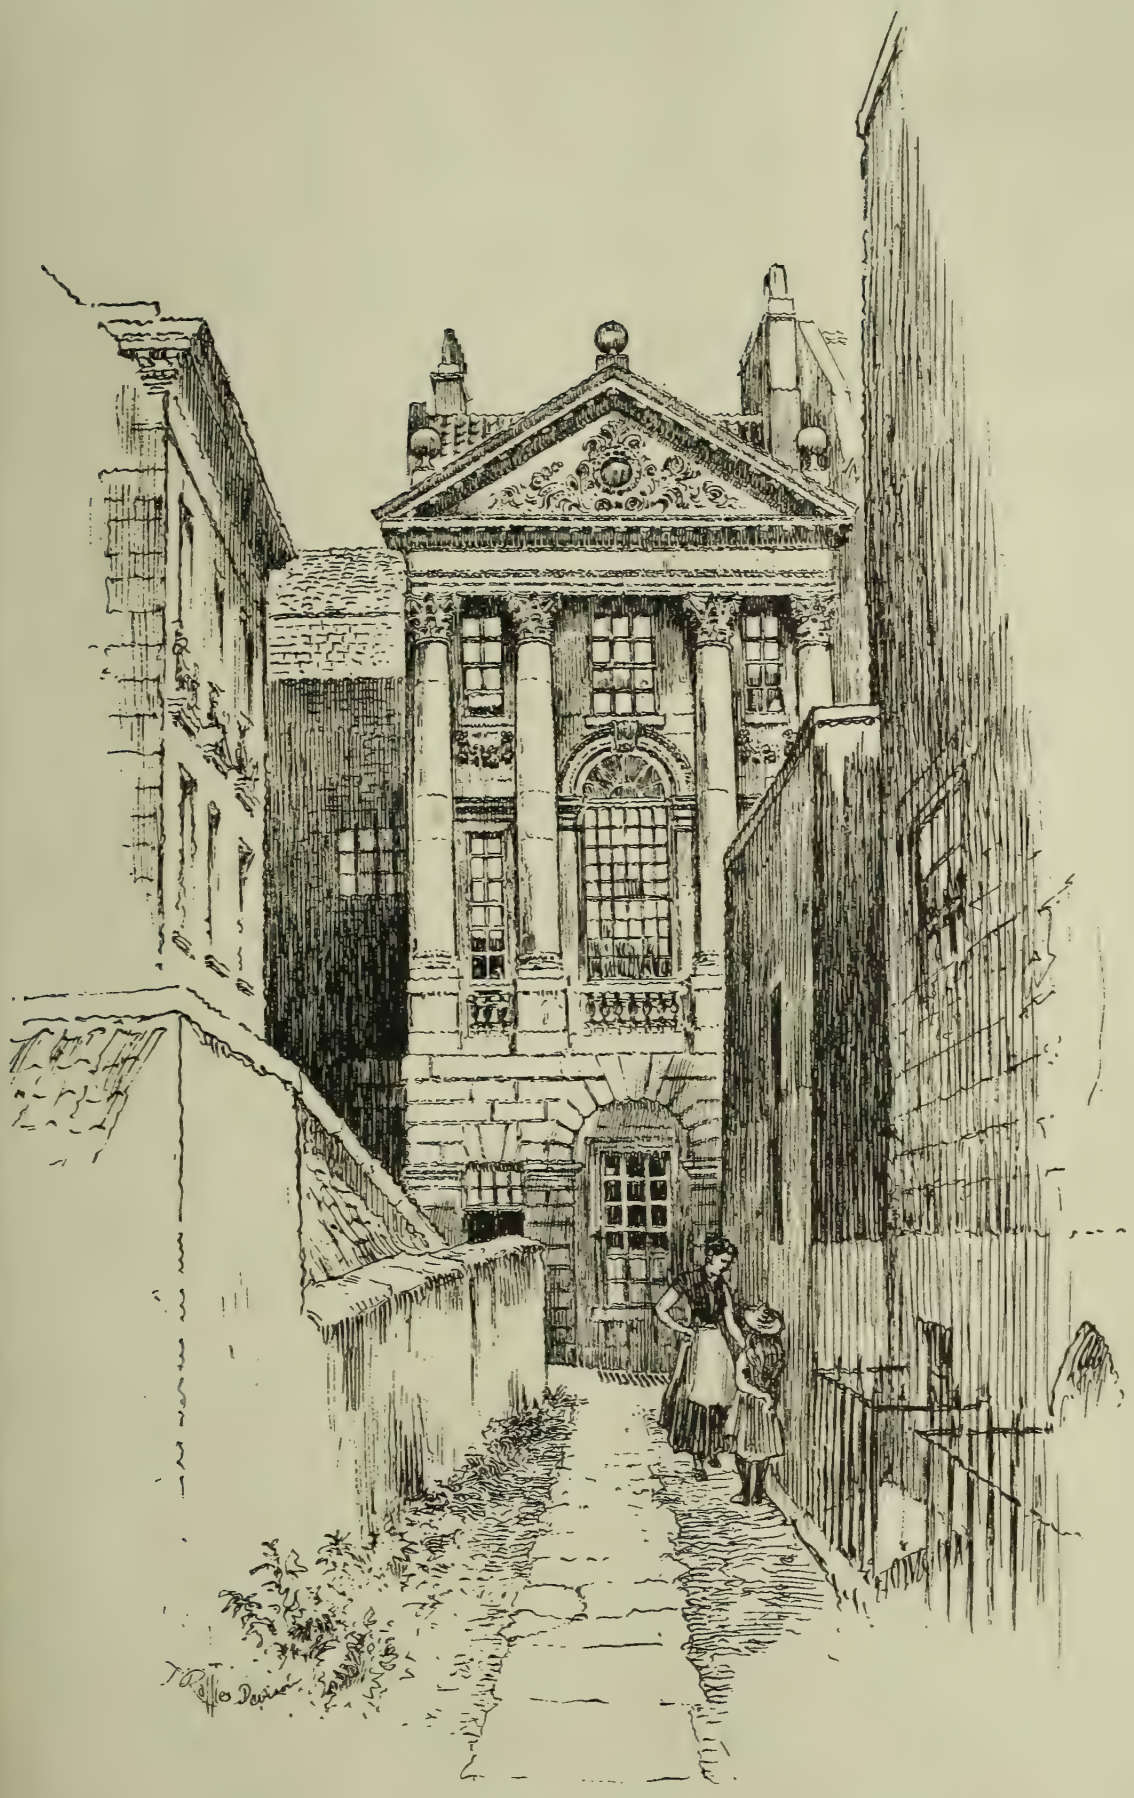
Narrow Street Improvements, Peterborough.

Peterborough City Council invite from architects designs for municipal offices, shops, etc., on the new frontage line in Narrow-street, Peterborough. Sir Reginald Blomfield, R.A., PP.R.I.B.A., is the assessor. Premiums offered are:—(1st) 500 guineas, (2nd) 250 guineas; (3rd) 150 guineas. Copies of the conditions, site plans, etc., may be obtained on deposit of £1 1s., from W. H. A. Court, A.M.Inst.C.E., City Engineer and Surveyor, Broadway, Peterborough.

Municipal College of Technology Extension, Manchester.

The Corporation of Manchester invite architects of British nationality to submit designs in a competition for an extension to the Municipal College of Technology, Sackville-street, Manchester. The assessors are Messrs. Alan E. Munby, H. M. Fletcher & Francis Jones. Premiums of £500, £400 and £300 are offered. Designs have to be sent in by Friday, March 30, 1928. Applications for conditions, accompanied by a deposit of £1 1s. returnable on receipt of a bona-fide design or on return of the conditions on or before Tuesday, November 15, should be sent to Mr. P. M. Heath, Town Clerk, Town Hall, Manchester.

Nottingham Market-place Competition.



The assessor of this competition, Sir Edwin Lutyens, R.A., has awarded the premium of 100 guineas—presented by the *Nottingham Journal*—to Mr. Frederick Hamer Crossley, A.R.I.B.A., 15, Arnside-road, Walla, Cheshire. The designs placed second and third were those of Mr. Cecil J. Parker, 3, Noel-street, Nottingham, and Messrs. Falk & Aylwin, Farnham, respectively. Sir Edwin Lutyens and the local advisory assessors, Messrs. J. Woollatt, J. Else, and F. W. Gregory, in making the premier award, "are of the opinion that Mr. Crossley's plan "has the great advantage of simplicity and gives a suitable setting to the Exchange. Traffic has been properly considered both in connection with general through routes and the immediate vicinity of the Exchange. Ample accommodation is provided for any general assembly for which the Market-place might be required."

So far as the designs placed second and third are concerned, the assessors' notes are as follow. Mr. Parker's plan:—This is a direct and simple design, but the use of dome in the position indicated is not a practical one position. The placing of the Queen Victoria statue is good, but the termination of the paths is somewhat weak.

Messrs. Falkner & Aylwin's plan:—This is one of the most complete sets of drawings submitted, but the scheme is too ambitious. The plan is attractive looking, but the obstruction of the main-line traffic from Wheeler-gate to Market-street mars the scheme as a whole.

Municipal Buildings, Beckenham.

Mr. Septimus Warwick, F.R.I.B.A., has been assessor in this competition, has made the awards as follows:—1st, Messrs. Lanchester, Lucas and Lodge; 2nd, Messrs. E. Keynes Webber and J. O. Cheadle; 3rd, Mr. Percy Naseby Adams.

ARCHITECTURAL TENDENCIES IN AMERICA.

On Monday evening an extra general meeting of the Royal Institute of British Architects was held at No. 9, Conduit-street, W.1, to hear an address by Mr. Harvey Corbett (of Messrs. Helme & Corbett, architects, New York) on "The Latest American Building Methods." The meeting was well attended by architects, builders, and operatives' representatives.

Major Harry Barnes occupied the chair, and in opening the meeting Mr. E. Stanley Hall (Honorary Secretary) recalled that in February last a paper by Mr. Corbett on "Organisation and Cost of the Building Industry in America" was read at a general meeting, and was followed by an interesting discussion, in which representatives of the National Federation of Building Trades Employers and the National Federation of Building Trades Operatives took part. In view of the statements in the paper comparing the cost of labour and materials as between America and this country, the Architects' and Builders' Joint Consultation Board and the Architects' and Operatives' Joint Consultation Board decided that the matter required further careful investigation, and on their recommendation the Council of the Royal Institute agreed to the appointment of a Joint Committee of Architects, Builders, and Operatives to make an inquiry into the whole question.

In the course of his address, which was illustrated with aerial views of New York, and slides showing imaginative drawings of what might be in the future owing to increasing traffic congestion, Mr. Corbett said in America, unhampered as they were by tradition, they were developing something which he thought would be of world interest. They had a new form of construction (steel) which had revolutionised architectural ideas, and architects found themselves confronted with the problem of doing their work from a totally different angle from the one they had been following in the past. For 6,000 years Egypt had only one structural principle, the post and lintel; then Rome produced the arch and gave the great free spaces never used in buildings before: and these two structural principles were all the world had up to about 50 years ago. In spite of all the changes in style, structurally speaking there were only the two principles of post-and-lintel and the arch available. Then came steel, and skeleton construction, which was now the accepted method of construction. It made possible the piling up of stories to tremendous heights.

Speed and steel were the two factors that had most effect on American architecture to-day. An additional factor, which was a result of those two, was a new conception in regard to the permanency of buildings. In the past buildings had been erected with the intention of lasting indefinitely, but with steel construction the idea that a building was necessarily permanent had been gradually replaced by the idea that a building was designed for a specific purpose and a specific time, and that its life was limited by its usefulness for its purpose. In commercial buildings in America they designed buildings to last 25 or 30 years, although the construction was as sound as ever. They did not actually know the life of steel in terms of centuries; they felt that from the structural point of view the building was quite as durable, but they did not expect it to last centuries from the point of view of useful service. At the end of 25 years or so they expected a building to be pulled down and replaced by a new building that would serve its purpose better. That had brought a tremendous change in the architect's problems. Old forms were found to be no longer applicable to present-day needs, and rate of construction had to be considered in terms not of years but of months. Style changed with amazing rapidity; just now he could not say what was the style of architecture in New York—he had been away for six weeks, and the style might have changed since he left!

He would be the last in the world to suggest skyscrapers for London. What was being done in America was not necessarily suitable for London. But he did think that in America they were creating a style of architecture that was indigenous to that country, and it was a style that would go down in the history of historic architectural styles. It was not the fact that in New York there was no room to expand; in Manhattan Island the actual quantity of building, if spread over all the available space, would not average four stories. The skyscrapers were concentrated in certain areas. The tendency was to concentrate skyscrapers in which certain types of business were carried on, and that led to a very efficient method of carrying on business. In such a skyscraper group a great many people with similar interests were brought together in a small area. In 42nd-street, where he had his office, all the building interests were concentrated, so that within 15 minutes he could be in the office of any other architect, or of any builder, or materials merchant. It would be possible to make 20 appointments in a single day in New York, whereas in London four or five were probably the limit.

Skyscraper development in New York was the result of a real economic idea; it was business efficiency, and if it had not been for that he did not believe they would have the skyscrapers they had to-day. The original skyscraper might have been the result of the anxiety of a property owner to develop his property to the utmost, but that kind of exploitation could not continue unless there were a fundamental reason for such upward growth. That fundamental reason was greater business efficiency. The development of the tall building was resulting in an amazing jumble, until about ten years ago zoning laws were brought into effect to regulate the height and uses of buildings. The zoning laws were based very largely on the London Building Acts, but it was, of course, impossible to reduce the height of a city that had already produced skyscrapers to the same level as London.

In America to-day the architect was a sculptor in building masses, and the materials with which he worked were the practical conditions of the problem and the restrictions of the law. His problem was to produce the most interesting silhouette, the most interesting mass, the most interesting form. Detail and style were secondary considerations. In New York the most interesting modern structure was the Telephone Building. Here the architects had approached the problem with respect for the present machine age. They did not think in terms of past styles, but in terms of the labour and machinery and materials of to-day, and that spirit had been carried out all through the building. The cornice had disappeared altogether, because it was meaningless at a height of 40 stories; cornices were very rarely used in Am tall buildings. Vertical accent was lost, even at the top of the building. I the marble, instead of being carve pilasters and caps, had all been design that it could be worked in a ma In the past, architects designed materials with respect to the means the of working them; to-day the archi problem was to do the same thing, usin *new time* as the basis of design, and so duce something that was characteristic present age. The ideal of modern arc ture should be something that was expr of the spirit of the age, but what at the time recalled the past.

In discussing the design of the skysc the lecturer showed a series of slides to out how design was affected by the z laws. Under these laws a tower occu 25 per cent. of the area of the building be built to any height without restri the remainder of the building was rest to a vertical wall face in proportion width of the street, and a gradual ste or sloping back from that level in confo with a line drawn from the centre o street through the centre of the corn the level of the top of the permissible v wall.

The first of the series of slides a sketch showing a tower in the centr plot soaring up to the clouds, flanked o side with a mass vertical to a certain and above that sloping back to mee tower, the angle of the slope being reg by law. The second slide showed the foreshortened to an economic height, a masses at the base cut into to give the sary lighting wells. The next stage s the flanking masses foreshortened to eli the acute angle where they joined the and the final picture represented a bu whose design had been governed sole these practical considerations.

New York is, he continued, suffering severe traffic congestion, and among th gestions for relief was a proposal to elevated side-walks for pedestrians only idea was illustrated on the screen in v stages of development. The final showed the whole of the street availab vehicular traffic, and, further, the bui were cut into at the ground floor to parking space; thus the upper parts buildings overhung that part of the ro used for parking. At about the fourth level the buildings were again set bac the footways placed on the floor Arcades and balustrades were placed the edges of these elevated footways, were covered, and the footways on eac of the street connected by bridges at fre intervals and at road crossing. The le expressed the opinion that something on lines would have to be introduced in or forty years' time. A further develo might be, he said, the use of that pa the building below the footway for bu purposes and the upper part for resid so that instead of transporting half the lation to and from the centre each da workers would be living above the pr in which they worked.

In conclusion, he said he thought the would come, and it was not very far di when there would be a period of beau art as great as that of the Greeks. Greeks were able to create what they d cause a small group of artists, assisted large slave population, was able to itself entirely to thoughts of beauty. not likely that a slave population woul be re-created, but we had slave mac and there was no reason why the ma could not be used to relieve humanity burden of labour and leave them free vote their energies and thoughts to m the world finer and more beautiful.

In proposing a vote of thanks, Dr. mond Unwin said he would hesitate to a forecast that building would co in America for the next thirty or forty at the same rate as it had done in th four years. He attributed the rapid

uilding in America to two considerations, h of which were themselves likely to nge very considerably in the future. One the fact that in the past the regulations mitted a 20-story building to be erected gside a three-story house, but that was onger possible; in the future there should be the same tendency to change from one to another, and that should regularise user of buildings. The other considera- was the phenomenal growth of popula- in the past, which was now slackening n owing to the Immigration Laws and r causes. That would tend towards ilisation in the future. He did not be- e the future would depend upon the con- ration of great masses of people on small s as had happened in parts of New York. spite of all that had been done to mini- e the disadvantages of such concentration, elieved the disadvantages still outweighed advantages. With such concentrations of ulation he did not think we could possibly with the traffic problem in this country; it remained to be seen whether the ericans could deal with their own ever- easing problem.

r. E. J. Brown (Director of the London ter Builders' Association) seconded the lution.

n the brief discussion which followed, H. A. Welch asked the lecturer what could be expected in a steel-frame build- —In reply, Mr. Corbett stated that the knowledge on this subject was derived n investigations on steel-frame buildings had been demolished. About twenty rs ago a 22-story steel-frame building was en down, not because it showed signs of ay, but because it was desired to erect ore modern structure on the site, and no s of deterioration of the steel were to seen. The lasting properties of steel de- ded entirely upon its absolute protection, the only doubt they had was as to the tiveness of the protection at the time the ding was erected, because this depended rely upon good workmanship. Provided steel was effectively protected from sture, there was no reason why a steel- ne building should not last as long as any r type of building. However big a build- if failure of part of the steel frame rred it would not be a serious matter. He not believe it would be possible for a l-frame building to collapse; all that ld happen would be that one point would . and plenty of warning would be given hat it could be put right.

r. H. V. Lanchester said in this country itects were prone to think of building much as detail and ornament. The lec- r's suggestion that there was more to be e in the way of looking upon a building sculpture rather than decoration was a wholesome corrective.

r. H. J. Rowse said there were two ols of architectural thought. One said we should tear up all that had been left s and do something new; the other said we must follow tradition. The lecturer told them that the conditions that rned architecture would make their style hem. Mechanical devices would play a great part in the building work of the e, and more attention should be paid to side of architecture.

r. J. Murray (Operatives) said they iently heard that the building operative merica far surpassed the British opera- he had seen many of them, but would take his hat off to any of them. If the rican operative had to do the work as as it was done in this country there d be no greater output in America than On the point of the length of the use- ife of a building he said it had to be usly considered whether buildings should uilt for present requirements or for pos- y. That particularly applied to houses; is opinion it was ridiculous that we ld build houses for people to live in a red years hence, when conditions would, oubt, be completely different.

WHAT IS REINFORCED CONCRETE?

A REPLY TO THE A.A. PRESIDENTIAL ADDRESS.

We have received for publication the following letter from a correspondent interested in reinforced concrete:—

Sir,—Opinion as to what is good or bad in architecture may be a matter of individual taste, and as one cannot libel an art, or a particular style of architecture, or a building material that is not a proprietary article, presumably everyone is entitled to express his thoughts on the architecture of the past, present, and future. So that, although many will not agree with Mr. Jenkins's remarks on the design of reinforced concrete buildings, made in his Presidential address at the Architectural Association last week, no one can complain of his wholesale condemnation of reinforced concrete as a medium for the expression of architecture.

But when an attempt is made to give added weight to the expression of artistic opinion by criticising reinforced concrete as a material, one could have hoped that he would have been more convincing in his facts and statements.

In the first place, one would like to point out that many of the problems of reinforced concrete mentioned by the author are also inherent in steel construction, although the paper suggests that they are peculiar to reinforced concrete alone. For instance, it was stated: "The crushing weight [? strength] of the new material is very high, and therefore supports might be reduced to a minimum." Surely a high compressive strength which permits economy in material is not detrimental in a building material? If, for the purpose of design, the supports are needed larger in section than the minimum that will carry the load, there is no reason why they should not be increased to any size to suit the artistic eye of the architect. This is done every day in other materials, why not in reinforced concrete?

It may be agreed that "the colour [of concrete] is ugly," but why should "any form of covering or coating used to hide its lack of sightliness result in second-rate architecture?" Is every steel-frame building in the country "second-rate architecture" because the steel is covered with stone "to cover its lack of sightliness"? And every whitewashed or tile-hung cottage? Is Sir John Burnet's British Museum Extension "second-rate architecture" because it is of reinforced concrete with a stone facing? And old Regent-street, was that "second-rate architecture" because the brickwork was coated with plaster and paint?

On the question of form we are told, "The material being erected in shuttering or moulds, the resulting forms must of necessity be coarse and lacking in refinement." The answer is to be found in the same number of *The Builder*, in which illustrations were given of some delightful moulded concrete figures and ornamental work. Because it is moulded as a plastic material, concrete is admirably adaptable to any form the architect might conceive. Is plaster decoration coarse and lacking in refinement because it is moulded? Or bronze sculpture?

The architect is said to have no control over reinforced concrete work, but is not that because he rarely has the knowledge necessary to design the material? It is no fault of the material if the architect has to call in a specialist to design it. And how many architects design structural steelwork, heating systems, and other specialist work in an important building?

When he states that "work is very slow owing to the time to be allowed before the centering can be struck," it can be stated in reply that with modern Portland cement even the undersides of floor slabs and beams can be struck in four days, or in twenty-four hours with aluminous cement.

The statement that "All the services have to be run on the surface" needs no comment.

"Lasting qualities," we are told, "have yet to be proved," and as proof that reinforced concrete is not likely to have any lasting qualities the lecturer reminds us that "The havoc wrought by the expansion of rusting iron on the west front of Peterborough Cathedral is common knowledge. . . . One has only to walk round Bedford-square to see the stone plinths of the iron railings split in dozens of places from the same cause." This might be a convincing argument if it had any bearing on the question. But it has not. The reinforcement used in concrete is *steel*, not iron. And concrete is not stone. The trouble at Peterborough Cathedral is due to the porosity of the *stone* allowing water to percolate through to the *iron* embedded in it. The trouble with the plinths in Bedford-square is that the *iron* railings are let into a soft *stone*, which is permeable; moreover, in many cases the railings are cemented in so that there is a small channel around them which collects water. Peterborough Cathedral and Bedford-square's railings are no more related to reinforced concrete than is a breeze slab to an engineering brick. Properly-made concrete is sufficient protection for the steel in reinforced concrete to prevent rusting. A comprehensive series of tests has been in progress for many years by a special Committee of the Institution of Civil Engineers, from whose reports the following information is taken: In the case of a reinforced concrete wharf in the Brisbane River, "after 5½ years no deterioration from rusting of the steel can be seen on close examination . . . and possibly no corrosion will take place at all." At Devonport Dockyard, a reinforced concrete landing jetty built in 1913 "is practically perfect (1922)." The piles to a jetty at Devonport Dockyard "erected about sixteen years ago . . . are in very good condition and practically no deterioration of any description is apparent (1922)." At Moon Cove (Devonport) a ferro-concrete pile jetty erected about the same period "is in very sound condition (1922)." Authoritative statements proving that, with a proper covering of good concrete, reinforcement remains armour-bright after many years immersion in sea water could be continued indefinitely.

Now that concrete, or the form of concrete known as granolithic, is used practically exclusively for floors in large buildings, one would have thought floors might have escaped criticism. But we are told. "Some will tell you that the surface [of concrete floors] must be kept wet for several days if cracks are to be prevented, others that any surface over 50 ft. in superficial area will crack unless a rubber strip or other means is adopted to completely disconnect one section of the pavement from the next." It is well known that concrete must be kept wet while it is curing, and any good text book will tell us that the coefficient of expansion of concrete is 0.000006 per deg. Fahr., so that the likelihood of cracks resulting from volume changes in a slab 50-ft. super need not keep us awake at night.

"An eminent engineer" is stated to have applied what is called "the doctrine of the if" to concrete to such good purpose that he has discovered no less than seven elementary everyday duties of a contractor which, if not carried out, will result in a faulty building. But two important "if's" were omitted. We should have been reminded that, (1) *If* the cement were forgotten there would be no concrete; and (2) *If* the operatives did not place the concrete in the shuttering at all there would be no building! To carry the "doctrine" to other methods of building, if bricks are laid without mortar they will not hold together; if pipe joints are not properly made, they will leak; and so on and so on.

H. L. C.

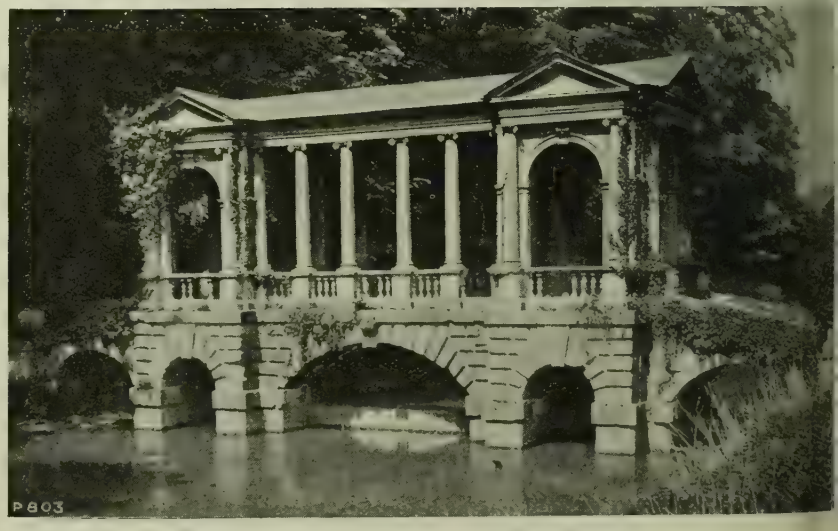
JOHN WOOD BI-CENTENARY CELEBRATIONS AT BATH

ON Tuesday last the bi-centenary of John Wood's coming to Bath was celebrated in that city by a series of functions. Though mainly concerned with the elder Wood, the celebrations were also a tribute to the younger Wood, who carried on the work of his father. Thanks to the enterprise of the Great Western Railway Company and to the activities of the civic authorities, the local architects and others, and the visitors who attended from different parts of the country, the event was a complete success in every way. The proceedings began with a luncheon at the Guildhall, given by the Mayor, Alderman Cedric Chivers, whom illness kept away. His place was taken by the Mayoress (Madame Sarah Grand). Among those present were the Earl of Crawford, Sir Kingsley Wood, M.P., Parliamentary Secretary to the Ministry of Health, Sir George Oatley, Capt. C. T. Foxcroft, M.P., Capt. Gunstone, M.P., Mr. Walter Tapper, President of the R.I.B.A., Mr. Gilbert Jenkins, President of the Architectural Association, the Deputy Mayor (Councillor C. H. Hacker), Sir Harry Hatt, and Messrs. W. H. Fraser, Chief of the G.W.R. Publicity Department, E. C. Matthews, Ernest J. White, C. J. Orton, Hon. A. Methuen, Aubrey Bateman, Lieut.-Col. Waller, J. H. Elder-Duncan, W. F. Underwood, W. H. Griffiths, W. C. Wood, W. J. Palmer-Jones, G. C. Lawrence, T. Sturge-Cotterell, Arthur T. Bolton, J. Bolton, Mowbray Green, C. F. W. Dening, B. John, F. D. Wardle, J. S. Roche, the Town Clerk, A. J. Sims, Ian Macalister, A. J. Taylor, W. J. Newton, F. R. Yerbury, Sinclair Baddeley, John Hatton, R. W. M. Wright, David Evans, W. T. Plume, A. E. Payne, Alderman A. W. Wills, C. S. Thomas, G. D. Gordon-Hake, C. F. Ward, Alderman C. H. Long, Capt. A. A. Lewis, F. P. Sissons, H. C. Smith, A. H. Foster, H. Brice Mundy, W. E. Sutherland Read, and B. F. Brueton.

There were only two toasts at the luncheon, those of the visitors and the Mayor, after which the visitors made a tour of the city in order, under the direction of Mr. Mowbray A. Green, to see some of the chief examples of Wood's work. Later there was a gathering at the Pump Room to hear speeches by Earl Crawford, Sir Kingsley Wood and others, and then tea was served in the Pump Room. Here also was to be seen a specially interesting exhibition of original drawings by John Wood, and prints, documents, photographs, etc., relating to his work. During the tour Mr. Walter Tapper placed a wreath on Wood's house.

Proposing the toast of "Our Visitors" at the luncheon, the Mayoress said that Bath, to those who loved and appreciated her, was like Cleopatra, "Time cannot wither nor custom change her infinite variety." And Bath had an atmosphere, such an atmosphere that was neither to be analysed nor defined. They had been given that atmosphere by the great architects who had embodied in imperishable stone the beautiful thoughts that beset. Some time ago, continued the speaker, she met an eminent medical man, who said that in the case of nervous diseases a change was better than any other form of treatment. But it must be the right kind of change. "And the only change," he said, "that has the effect of a real cure in my experience is a mental change. I am satisfied with the colour of the old city, the grey and green; the wonderful curves of the city and its crescents, which have the effect upon me of a note played by a great artist upon a violoncello. I feel I absorb the atmosphere of Bath, and I come under the influence of soothing harmony, which is the beauty of your old city."

That atmosphere, said the Mayoress, was the expression which interpreted to them better than anything the secret of the power of Bath, the secret of its healing, and perhaps more of its healing than comes from its waters. It was the soothing effect of that harmony of beauty which sustained their souls. They heard a great deal of talk of artists, of painters, writers and sculptors, but why did we not hear as much of architects? . . . When we began to think, we did realise what we owed to the architects, who had surrounded us with such beauty as distinguished that old city of Bath.



Mr. G. H. Jenkins, replying, said that Wood was enabled to make Bath what it was to-day on account of the fine stone which he had at his disposal. A great deal of building had taken place since the war which architects regretted. He rather feared Bath had not escaped. But he understood the city had taken steps to control this disease of jerry building, and that in future they intended to see that nothing was erected to mar its beauty, and that, instead, new buildings should help to enhance the fame of the old city. They all congratulated her on that wise decision, which she was almost the only city to take.

In proposing the health of the Mayor and Mayoress of Bath, Dr. St. Lawrence Finney, Mayor of Kingston-on-Thames, spoke of the close association of that borough with Bath, in that King Edgar was crowned in both boroughs, also recalling that the late Major Davis, the City Architect, was, before he came to Bath, Surveyor of Kingston-on-Thames.

The bicentenary speeches were delivered, after the pilgrimage, in the Pump Room. The DEPUTY MAYOR, Councillor Hacker, who presided, said they who were citizens of Bath might claim to be alive both to the importance of preserving what was old and beautiful in their city and to the necessity of not merely resting content with the achievements of their forefathers but of playing their part in this generation. Business premises and public buildings had been erected in Bath during the past year or two which were a credit to the city as well as to the enterprise of the firms and authorities concerned. No one had ever realised better than John Wood the supreme importance to Bath of the hot springs—"the staple commodity of the City," as he called them, for "the British Empire" (a striking phrase 200 years ago), and his desire to see the benefits of the waters made available for the poor as well as for his wealthy patrons was shown in the generous gift of his services as architect to the Royal Mineral Water Hospital. And one was glad to see this same appreciation of their wonderful waters and the same generous tradition exemplified in their own architect to t Baths to-day.

SIR KINGSLEY WOOD, Parliamentary Sec tary to the Ministry of Health, said t Bath needed no memorial to John Wo The city was his memorial. But it could proud that it had kept up the tradition beautiful building. In 1925 the Corporat won from Parliament the power to cont the design of buildings. The clause t initiated had been allowed in other local A and was now included in the series of to planning schemes published by the Minis of Health. The chief interest of John Woo work and life to a representative of t Ministry did not lie particularly in his gr skill as a designer of buildings or auth but because he did not think merely in te of houses, groups of houses, streets, a squares. Wood must be seen as one of pioneers of English town-planning. would, they were told, have liked to rebu the whole city. They had heard of dreams as a young man of 23, and he show foresight, which was lacking to-day, in quiring sites and projecting schemes outs the city boundaries. We who in so m places were the victims of haphazard careless building, which had doomed us congested streets and squalid slums, sho remember with gratitude a man like Wo whose work had shown us a better w The urbanisation of the country, with its good and evil results, had procee rapidly. One hundred years ago only 16 cent. of the population of England lived towns of over 20,000 people. In 1921, 61 cent. lived in towns of that size. Unre lated and congested building meant much health and inefficiency to the nation. were suffering to-day from our sedent lives, and the atmosphere of city life, p ticularly in the badly built and overb cities and towns.

Wood's life and work would not h achieved all that it rightly deserved merited if it was not an inspiration guide. England was in many respects most beautiful country in the world. we were in danger of destroying much its charm and loveliness by our careless and short-sighted policy. We must s indiscriminate building, and we must proc much more rapidly with great town-plann schemes. Mr. Chamberlain said the o day that we must not be content until ev square inch of the country was subjected town-planning of some kind or anot Happily this was the course we were at pursuing. 385 schemes were prepared, co ing 3,000,000 acres of the country. We also to clear or recondition those slum a which were a disgrace to our present civil tion, and were nurseries of crime and dise That celebration would have served its p

Roman Bath and Abbey, Bath.

if it had turned the attention of Bath the country to those things and to the l which stood behind the work of Wood the tradition of John Wood himself.

ORD CRAWFORD AND BALCARRES said that d was a great and versatile man, a road- er, a map-maker, author, and architect, also a good citizen. He used his artistic rledge not merely for the improvement of house on which he was working, but for embellishment of the city as a whole. d impressed his personality upon Bath. r cities of equivalent size — Toledo, rtres, Malines, Haarlem, Nuremberg — did have the advantage of one consistent 's mind, with well-defined ambitions, a sure knowledge and intuition of what circumstances required. Wood not only new houses, but he improved old ones. gave to England a double architectural n. He showed that it was not only ble but serviceable to construct dwelling- es in great homogeneous groups, and he showed, what was not less valuable, that very narrow street frontage could be in- d with dignity and real charm.

R. WALTER TAPPER, President of the l Institute of British Architects, said John Wood dreamt dreams and saw ns, but many architects had not the same faction of seeing their dreams realised. as really an extraordinary thing that such ung man should have had the vision to what the city should be. It was remark- that modern cities, like Manchester, s, Bradford, etc., should have learnt so from Bath, about which there was an rly distribution which could not be found many modern cities. During the last years or more there were many seaside s in this country, and in America and in Dominions there were towns innumerable, rarely had there been vision to see the ute necessity of someone to help in the ut of such places. Of course, in the eenth century the study of architecture he fine arts was part of the general edu- n of a gentleman, and such men no doubt red a nice discrimination about archi- re; and that was one reason why we Bath to-day. The people responsible de- a fine city, and if people really desired things they could generally obtain them. s little use talking about the fine archi- ral quality of Wood's work at Bath s we tried to learn the lesson his work t us. Architectural knowledge was of e unless it was made use of. We did nake the use we ought of such an ex- e as Bath, the lay-out of which did not about in a haphazard way: it was desired by the people and was brought about by profound study.

A feature of the celebration meeting was the playing of eighteenth-century music by the Bath Pump Room orchestra, under the direction of Mr. Jan Hurst.

An interesting extension of the famous baths, designed by Mr. Alfred J. Taylor, F.R.I.B.A., has just been opened. This consists of the old Royal Baths. The Hot Bath, as rebuilt by John Wood the younger, forms the central portion of the building. The main lines and the façade designed by Wood have been retained, together with many of the original features in the small entrance hall. The decoration has been carried out in the strict Georgian manner. Almost under the bath-house rises the Hot Spring, so named to indicate its high temperature. The water will be served for internal use, and it has been found possible to obtain a natural flow without having recourse to pumping. The new department of the Bathing Establishment has been set apart for intestinal douche treatment.

BATH—SOME SUGGESTIONS.

FROM A CORRESPONDENT.

"That beautiful city which charms even eyes familiar with the masterpieces of Bramante and Palladio"—so wrote Macaulay. "Bath undoubtedly took one of the highest places among all the cities of Europe, and certainly a very high place among the cities of the world"—so Lord Harvey.

Whatever may be the facts, there is no doubt that Bath owes a great deal of its permanent value to four or five men: the two Woods, Baldwin, Killigrew Greenaway, and a few others. We should not separate them too strictly; they were all speculating builders, and rivalry formed a considerable part of their stimulus to endeavour.

Classic Bath does not strike the lay observer quite so devastating a blow as it did in the days of Macaulay; the stone has weathered to a rather drab appearance somewhat similar to the stucco of Plymouth or Baker-street, and the various items, the Crescent, Circus, Square, and so on, are rather separated. The Abbey yard and Pulteney-street are more impressive, but the true inwardness of the architecture of Bath is not attained till one has penetrated to the Cross Bath end of Cross-street. Here one feels the atmosphere of eighteenth-century England at its best, and it is almost impossible to believe that these streets are not at quiet times peopled with ghosts of fair ladies and gay clad courtiers of the time.

Fortunately, Cross-street has been saved from the devastation threatened some years ago; one side at least is carefully preserved, but the other is still disfigured with abominable lettering and the marks of inconsiderate commerce and a fountain covered with greenery, obscures one end. It would be a great achievement and a worthy way of celebrating the bi-centenary of Wood if something could be done to bring the separated items of architectural Bath together, schemes for which were prepared by Mr. Robert Atkinson, and also, I believe, by Jemmett and McCombie.

There are many smaller matters which I would commend to the attention of commemorative committees.

(1) The surroundings of Ralph Allen's house (the elder Wood) should be opened up so that it could be seen in its intended setting.

(2) Wolfe's house in Trim-street should be in public hands and should house the various relics of the general and his family. Incidentally, it has surely the most dignified Georgian door frame in the country.

(3) All the houses in the courts south of the Abbey should be in public hands, and should be restored to their original vocation. Most of these fine old houses have superb staircases and internal features. One of each period should be furnished with appropriate stuff and household belongings, even to figures in the costumes of the time, and shown as educational museums (this would be a paying proposition). The elementary school should be removed and a garden made in its place.

The city has an excellent Art Gallery with showrooms of objects of vertu, and also the excellent museum at the end of Pulteney-street, but these are filled with objects interesting more to the dilettante and the connoisseur, and have really little popular interest.

(4) The advertisements on the sides of Pulteney-bridge should be torn down.

(5) I am doubtful if a better place could not be found for flowering plants than the entablature over the Colonnade (Baldwin) outside the pump room at the west entrance of Abbey yard.

In conclusion, may I suggest that at least a few of the sights of Bath might be open on a Sunday. It was my misfortune to be last in Bath on such a day, and I found everything, even the Abbey and at least four out of five teashops, shut, and the town one of the dullest places in which to spend a summer afternoon.

ILLUSTRATIONS

Municipal Buildings, Beckenham.

We illustrate this week the winning design in this competition, by Messrs. Lanchester, Lucas and Lodge. Mr. Septimus Warwick, F.R.I.B.A., was the assessor. The full awards are given under Competition News, page 684.

In arranging the building on the site the electrical department has been located on the High-street frontage with ample showroom windows to that street, whilst the main entrance is shown on Church-avenue. It was thought desirable to separate the clinics from the remainder of the public health department, and thus make possible a free circulation to this building without interfering with the work of the main block. By this arrangement it is possible to form a symmetrical group along the crescent centring on the large hall of the clinic, and leaving an ample site for the police court at the north-west corner of the site to balance the council office.

The council hall forms the centre of the plan and is covered by a low dome. Care has been taken to give access for the public direct from the side staircase without passing through the buildings. The robing room for the chairman adjoins the council-room, whilst his parlour has been placed at the front of the building, both to improve the outlook and in order that he may be conveniently near the committee rooms. The clinics have been arranged with the central hall suitably placed to serve either as a waiting hall or lecture room; if as the latter, the dental waiting room could form a platform by removing or folding back the partition between it and the hall.

A Bird's-eye View of Bath.

Apropos of the Wood Bi-centenary celebrations at Bath, we give this week a bird's-eye view of the city, by Mr. T. Raffles Davison.

New Business Premises, Birmingham.

The new premises for Messrs. Rowans, Ltd., form the ground, mezzanine and first floors of a large new building in New-street, Birmingham, which has been designed by Messrs. Essex and Goodman, of Birmingham. Messrs. Rowans' elevations and interior works have been designed by Mr. P. J. Westwood, F.R.I.B.A., of London, who has carried out work in Glasgow and elsewhere for this firm. The floors were taken over by the firm in skeleton, and have been fitted out, including the interior staircases, in oak.

The contractors were as follows :—Messrs. Thomas Rowbotham, of Birmingham (who also erected the main building), structural work, including the staircase; Henry Hope and Sons, Ltd., of London and Birmingham, heating work and metal casements; Fenning and Co., London, marble and terrazzo; Cuthbert and Taylor, of London, special and ornamental window glass; Bryan's Adamanta, Ltd., Birmingham, plaster work; Harris and Sheldon, Ltd., Birmingham, the whole of the bronze fronts and interior fixturing throughout; Tyler and Freeman, London, electric lighting; Skellorn, Edwards and Co., Ltd., London, pelmets, curtains, and blinds; Rowan and Boden, Glasgow, floor coverings; Sankey, Sheldon, Ltd., Birmingham and London, steel lockers; Lamson Pneumatic Tube Co., Ltd., Lamson installation; Yannedis and Co., London, ironmongery.

The photographs which we reproduce this week are by Messrs. Bedford Lemere and Co.

"Coty House," Stratford-place, W.

The illustrations of this work which we give this week show the interior and the front entrance of this fine town house, built by the brothers Adam, in 1793, as part of the scheme of development which comprised both sides of Stratford Place and Derby House at the end of the street. Of this scheme only the north and east sections remain more or less intact, including the premises acquired by Messrs. Coty (England) Limited, from the Countess of Mayo for use as the headquarters and stock rooms of the English branch of the business founded by Monsieur François Coty.

The problem of adapting this untouched and beautiful example of architectural decoration of the eighteenth century to the needs of a modern business was a difficult one, and was complicated by the discovery of serious defects in the structure, which necessitated the construction of a steel framework inside the existing building. The whole of this part of the work had to be carried out, by one of the covenants in the lease, without in any way disturbing the elaborate plaster ceilings or interior decorations of the principal rooms on the ground and first floors. These, and the rooms above, are now used as showrooms and offices, the stock rooms (which are lined throughout with compressed cork) are in the basement, while the unloading rooms, packing rooms, cloak rooms, lavatories, etc., are on the site of the old kitchen and offices, adjoining the new staff entrance from Marylebone-lane. The perspective view illustrates a scheme for the reconstruction of the first and ground floor façade and the main entrance from Stratford Place, which may be undertaken at some future time.

The general contractors for the alterations, reconstruction and redecoration were Messrs. Dove Brothers, Ltd., and the specialists and sub-contractors were as follows :—The Aston Construction Co., Ltd., constructional steelwork; Edgecumbe, Rendle and Co., Ltd., glazed roof to covered court; The Kleine Patent Fire-resisting Flooring Syndicate, Ltd., floor to covered court; The François Cementation Co., Ltd., basement floors in Betonac; W. H. Hunt, Ltd., hot water heating; Smith, Major and Stevens, Ltd., passenger lifts; Pickerings, Ltd., goods and service lifts; W. Newton, electric lighting; The Bath Artcraft Co., Ltd., and Pollards, Ltd., stock room fittings, etc.; Whiteside Fitments, and Yannedis, Ltd., bronze lanterns, wrought ironwork and door furniture, etc.; The Standard Cork Co., Ltd., cork linings.

The architect to Messrs. Coty (England) Ltd., is Mr. H. P. Cart de Lafontaine, O.B.E., A.R.I.B.A.; Monsieur Pontremoli, *membre de l'Institut*, was consulting architect for Monsieur Coty.

Nottingham Market Place Competition.

We illustrate this week the winning design in this competition, by Mr. F. H. Crossley, A.R.I.B.A. Sir Edwin Lutyens was the assessor, associated with a local board. The competition was promoted by the "Nottingham Journal."

The Rome Prize and Henry Jarvis Scholarship.

We illustrate this week the winning designs in these competitions. A critique of the exhibition appears on page 701, together with the Faculty's full awards.

MEETINGS

MONDAY, *November* 7.

Royal Institute of British Architects. augural Address by the President, Mr. W ter Tapper, A.R.A. Presentation of R.I.B.A. London Architecture Medal, 19 to Mr. Hubert Lidbetter. 8.30 p.m.

Society of Engineers. Mr. H. W. Tow on "Economic Transport." 6 p.m.

TUESDAY, *November* 8.

Royal Sanitary Institute. Major H. Barr on "The Royal Commissions on Health a Housing : a Retrospect and Forecast." 5 p.m.

Institution of Structural Engineers. D cussion on "Probable Building Material the Future." Introduced by Mr. E. Cotterell, L.R.I.B.A. At Chamber of Co merce, Birmingham. 7 p.m.

PARTHENON STUDIES.—IX.

By W. R. LETHABY.

THE WEST PEDIMENT.

If the interpretation is to be satisfactory it must have common sense on its side.—MISS JANE HARRISON.

Subject.—The general scheme of the sculptures of this pediment is well described in the more recent Museum guide-books (1906, etc.).

"The subject was the strife of Poseidon and Athenè for the soil of Attica. This contest, according to tradition, took place on the Acropolis itself. . . . The victory was adjudged to Athenè. The award was made with Cecrops acting as judge or as witness before a tribunal of gods. The spot was marked in subsequent times by the joint temple of Erechtheus and Athenè Polias, within which were the olive-tree produced by Athenè and the salt-spring of Poseidon.

"The central group of the two combatants, with their charioteers and two other figures, are of larger scale. The figures that occupy the extremities of the pediment are smaller, and they are evidently spectators. They are representative of the mythic inhabitants in whose presence takes place the creation of the tokens on which the Olympian gods must give judgment. If it is assumed that the company of spectators must be regarded as continuous behind the central incident, close parallels can be cited from fifth century art."

Notwithstanding this clear statement of a simple subject, the interpretation of the several figures as written under the marbles in the Museum is difficult to understand and almost inconsistent with it. Of the first, for instance (A), we read in the current *Guide* (1925): "This figure has been called a River-god, usually the Ilissos, one of the two rivers of Athens. The name has been disputed, but, like that of Theseus, it holds its ground." As we may see from the same *Guide*, however, the identification of a figure in the other pediment, as Theseus, does not hold its ground. Passing to the right-hand group in the west gable, we are told of Q.: "The name is quite doubtful. The figure has been called Leukothea (a sea goddess). V., a nude male, is supposed to be a local personification. W., a reclining female figure occupying the angle, is supposed to be a local nymph, and is often called Callirrhoe, the nymph of the famous Athenian fountain. On this supposition the youth V. has been called Ilissos in place of A, since Ilissos and Callirrhoe were in close connection." These are very vague and contradictory suppositions, and no positive conviction, it will be observed, is expressed. Of course, Museum authorities are in a difficult position, for the identity of figures known by certain names in old publications has to be maintained, and much confusion would result from renaming them every ten years.

Still, there comes a time when the mere sceptical recital of what has been supposed is not enough; we want to be told what is the most likely theory, and we would like to ask: But what do you really think? Bold revision must be faced some day. I doubt if anybody can now believe in the local personifications: Callirrhoe, the famous fountain, seems to have been covered in by the time the Parthenon was built, and a drain would hardly have been personified on the pediment.

The names at present given to the figures are based, with some amendments, on the suggestions of Visconti, whose main principle was that the spectators in either half of the pediment, with the exception of personifications of rivers in the angles, were the supporters of the rival gods. He also suggested that Cecrops, "who bore witness to the prodigy wrought by Minerva" (Athenè) would have been one of the group on the left.

That Cecrops would be in the pediment none can doubt. "With Cecrops first King of Athens, the mythology of Athens begins; he is a person in art as well as literary tradition. Cecrops gave his name to one of the Attic tribes. He numbered the people, established marriage; he was to the Athenians their first civilised man. Tradition connected him with the strife of Athenè and Poseidon. . . . Sometimes it is Cecrops, sometimes the Athenians who decide." (Miss Harrison's *Athens*).

As long ago as 1821 Leake disputed the identification of the first figure as the river Ilissos, observing correctly that the figure was "rising and advancing his body to behold the great action at the centre of the pediment." The figures were the primitive heroes of the Athenians. In 1841 he extended his system of identification—the chief spectators on the left of the centre are Cecrops and his daughters; the reclining male figure in the angle of the pediment (Visconti's Ilissos), and a lost companion were Amphictyon and Cranaus, the successors of Cecrops. "According to one version of the fable, Cecrops testified that he had seen the olive planted by Athena. According to the other mythus, not only Cecrops, but his successors, Cranaus and Erechtheus, were also present. Pheidias followed the latter version. . . . Beyond the car [of Athena, on the left] were the three daughters of Cecrops with his son Ersysichthon. . . . Between the two male figures on the left [A. and Cecrops] there was evidently another figure, which has been thrown down by the fall of part of the cornice. If the seated male was Cecrops, the two remaining [that is the others, one of which is lost] were probably his successors, Amphictyon and Cranaus." He goes on to say that in the southern half of the pediment "a gap in the drawing" was probably occupied by another lost figure. (Fig. 1, *x* and *y* are the gaps.)

FIG. 1.

Leake gave the name of Erechtheus to the figure now identified as Hermes. Visconti had called this same figure Cecrops, and the Museum publications long adhered to that hypothesis, ignoring Leake's reasoning (*Handbook*, 1851). Then Watkiss Lloyd attached a snake-like fragment to the old man's figure on the left, and although he complained that he could not get his discovery recognised, it has slowly come to be accepted that it must be Cecrops. Before this time Cockerell had thought that the fragment was part of a serpent associated with the central olive-tree. In 1908 I showed that the supposed snake was no separate creature with a head, but, rather, the serpentine tail of Cecrops.

I must return now to the question of the "gaps" in the sculptures of the western pediment. In the drawing of 1674 two unoccupied spaces appear, one after the first figure on the left-hand side, the other before the two last figures on the right-hand side. Fig. 1 is from the tracing given in the Museum *Guide* from the old drawing. It has been disputed whether these "gaps" were caused by figures having fallen out or whether they were always open spaces. The question has been settled in regard to the left-hand gap (*x*) by the recent finding of a crouching figure which must have occupied this place, but no final conclusion seems to have been reached in regard to the right-hand "gap" (*y*). The filling of the left-hand space is itself a conclusive argument in favour of not leaving the other void. It is difficult to imagine from our small illustrations how disturbing such a gap would have been. The plain, bright colour of the field of the pediment struck across by shadows would have made a "hole" in the illuminated array of sculptures filling the pediment. A gap would, in consequence, have been the most striking and first noticed point in the entire composition. The existence of such gaps, one on either side, was hardly possible, but one only on the right appears to me wholly impossible. The pedimental groups of Ægina and Olympia show that the spaces were fully occupied—there were no gaps. One of the wonders of the master sculptor's skill was the setting up of these colossal images so that many of them remained in place for more than two thousand years. At some time, however, probably in the Middle Ages, the whole central part of the sculptures of the east pediment crashed, and the team of horses of the chariot on the right-hand side of the west gable also fell out, but the horses on the left lasted on until they were thrown over by art collectors in 1687. When the drawings of 1674 were made, general ruin was setting in. The falling of stones of the raking cornices of the pediments had thrown down figures in the west pediment, which formed the "gaps." When Dalton made his drawing in 1749 the ruin had gone much farther, and when Lord Elgin visited Athens most of the remaining figures had fallen. On the east front a stone falling from above threw down the figure of Selene and broke off parts of the adjoining reclining figure. Compare the drawing by Pars with that of 1674. We conclude, then, that there was a figure in the right-hand gap as well as in that on the left.

The figure in the left-hand gap was a male, so that on this side of the pediment there were three males next the angle, one being Cecrops and the outer one the noble reclining figure named "Ilissos (?)" at the Museum. This name was given to the figure because Pausanias said that reclining figures in one of the pediments at Olympia represented local rivers. Treu, the great authority on Olympia, will not accept such an explanation of the figures there; it was probably only local folklore, and its application to the Parthenon has special difficulties.

Furtwängler extended Leake's principle of interpretation. It is followed again in a theory put forward in America by Dr. Harriet Boyd Dawkins in 1924 that the reclining figure A represented Acteus, first King of Athens. The old museum names, Ilissos and Callirrhoe, must be given up in favour of those of Attic Patriarchs.

We have seen that Leake proposed to name one of the figures Erechtheus. Furtwängler, by suggesting that Erechtheus occupied the right-hand gap and that the figures about him were his family, just as the figures on the left-hand side were Cecrops and his family, gives a simple explanation to the whole composition, which to me was convincing from the first. He brought back the unities to the pediment. In 1912 Collignon, in the big French study of the Parthenon, fully accepted Furtwängler's theory. There is, indeed, no other scheme in which anybody can be said to believe, and yet the old names linger on. The evidence for Erechtheus beyond the existence of the "gap" is as follows:—Grouped with the figure of Cecrops is a frightened woman who clings to him for protection. On the other side of the pediment in a similar relative position was another frightened woman who leaned towards the right-hand gap, from which

e must have fallen. Furtwängler pointed that if this gap had been occupied by igure of Erechtheus the whole scheme d be easy to understand, for all the es on either hand would have been the dwellers in the land, the patriarchs of ns and their families witnesses of the of the gods.

We must conceive U* [the figure in the -hand gap] as a man sitting on the nd like B [Cecrops]. Not till we supply man who is wanting does the corre- dence and symmetry of the two halves ne pediment become complete." The on required to make all clear was Erech- s, and that he was indeed here is practi- proved by the fact that in the older le Athena was sculptured between ops and Erechtheus. The reclining es in the angles were spectators; that were personified rivers is "a baseless nation that collapses into nothing as as critically examined." Leake had that there must have been a figure in right-hand gap as well as in the left, his view is confirmed by many con- ations.

has now been proved that there was no on the left. The general rule of filling pedimental spaces forbids such gaps. y of subject would be against separating "people" from the rest by such an val. Considerations of symmetry show there must have been a figure here esponding to Cecrops on the left. The n of the figure that was next confirms for it was leaning towards the gap, as companion of Cecrops leaned (Fig. 1). he law of symmetry in these things there doubt. In his recent book on Olympia, Norman Gardiner says that the figures he pediments of the Temple of Zeus mpletely filled the available space . . . nged in symmetrical pairs on either side he centre, strict symmetry governs the osition." The bringing back of the e of Erechtheus allows of a simple and rent explanation being given to the e subject.

though, of course, Cecrops and Erech- s were not thought to have been rulers he same time, yet—as patriarchs had a of reaching a great age—several genera- of descendants may have been sup- l to have been born and married while ops was still alive. They appear to- r on vase paintings.

1915 I discussed the sculptures of the ment more fully than before in the *ington Magazine*, and for several details references I would refer to that article. pting the Leake-Furtwängler scheme, composition of the pediment I showed be set out thus :—

Man reclining.	Male crouching.	Man & frightened girl.	Two women & nude boy.	THE CENTRAL ACTION.	Two women & nude boy.	Man & frightened girl.	Crouching Male.	Maid reclining.

e motive of a frightened maiden seeking protection of an old man seated on a occurs several times on vase paintings.

Fig. 2.

In the Victoria and Albert Museum is a fine vase (400 B.C.) showing Boreas seizing Oreithyia, while five other daughters run towards Erechtheus. He has a long staff, and to show that he is an ancient his hair is picked out in white. Fig. 2 is a sketch of the man and nearest girl (see also Reinach I., pp. 352 and 485). This subject should be compared with the well-known Hermitage vase on which is depicted the dispute of Athena and Poseidon in a manner, as is agreed, which suggests that it represents in a condensed form the treatment of the subject in the pediment itself (Fig. 3). Here on

Fig. 3.

the right of the central action is another—the same—old man with a frightened maiden running to him. There can be little doubt that it represents Erechtheus, and that his figure was suggested by his image in the pediment. On considering this painting there can be little doubt that the old man and frightened girl meant, first of all, Erechtheus and a daughter. The group was so much of an understood formula that visitors to the Parthenon would notice it and say : "That must be father Erechtheus up there on the right. That other one like him on the left may be Cecrops—yes, there is his tail." That is how such things had to tell their story. The correspondence of the sculptures follows the parallelism of the stories. Miss Harrison says of Erechtheus : "He gets confused with old Cecrops; he even borrows his serpent tail sometimes. The three daughters of Erechtheus seem to have got confused with the more famous daughters of Cecrops."

Cecrops and Erechtheus appear together as spectators on a vase which figures another Attic myth—the Birth of Erichthoneos (Miss Harrison's *Athens*, Fig. 2). Cecrops is on the left and Erechtheus on the right. The latter, we are told, appears here as a pleasant anachronism . . . the whole vase is a little manual of Greek mythology; its inside picture shows Kephalos and Eos." Another vase in the British Museum illustrated in the same volume (p. 433) has painted on it the Birth of Athena. Here at each end of the scene is "a simple citizen spectator." Both are old men with long staves, and the one on the right has white hair. Who can they be but Cecrops and Erechtheus? Was it not understood that Athena was born, with Athens, in their time? The acceptance of Erechtheus in the proposed position on the pediment leads up to an explanation of the two figures in the right-hand angle of the pediment which are called "local personifications" at the Museum. The vase just described as "a little manual of mythology" has the figure of Kephalos in the centre associated with Cecrops and Erechtheus, and I have suggested the names of Kephalos and Procris for the figures of the pediment. Theirs is about the best known and most popular of Athenian stories. Several attempts have been made to find a place for Kephalos in the pediments, but none have been approved. Here he would take his proper place as the husband of Procris, daughter of Erechtheus. Furtwängler had given his name to the reclining male of the eastern pediment now known as Dionysos, and for the two figures of the W. pediment he proposed the names of another daughter of Erechtheus and her husband Butes, but allowed that they were rather shadowy figures.

Miss Jane Harrison summarises the early mythical history of Atheus thus : "After Cecrops came Cranaus, then Amphictyon, then Erechtheus." We may add that Kephalos would come in here perfectly as the fifth in this ancient dynasty in right of his wife, daughter of Erechtheus. It should be noted in regard to the number of women on both sides of the pediment that in early Attic stories descent was reckoned in the female line, and these women were the mothers of the tribes of the people.

Miss Harrison, who illustrated the Hermitage vase before-mentioned, says of it : "The connection of vase and pediment has been hotly disputed, but I believe it still to hold good." After describing the central action, she goes on : "The remaining figures are unimportant accessories added by the vase painter in the style of his day . . . The little temple in the corner, I believe, is intended to convey the notion that the idea is taken from the Parthenon." One of the arguments against derivation from the sculptures was the fact that Poseidon in the painting held a single horse, as if he had come mounted and not in a chariot. The horse, however, on the vase has chariot harness, and it is easy to see that only one may have been put for reasons of space.

All the secondary figures on the vase were, I believe, derived from the same pediment. On the right, the King seated on a rock to whom a frightened maiden runs must be Erechtheus, and she his daughter (Fig. 3). Over this King is the small, temple-like structure, which is probably the House of Erechtheus on the Acropolis. In the small painting it looks as if it were imagined as a rude wooden structure. On the other side is a youth hunting, while over him is a reclining girl, who has long reminded me of the maiden in the right-hand angle of the pediment. The vase painter has given the hunting youth the appearance of Dionysos, but in both illustrations of Kephalos, given by Darenberg and Saglio, he has long hair and a garland like the figure on the vase. I cannot doubt that the subject of the vase as of the pediment was the contest of Athena and Poseidon, as witnessed by the primitive inhabitants of the Acropolis.

Reinach, who illustrated the vase, sug-

gested as doubtful identifications Dionysos for Kephalos, Cecrops or Zeus(?) for Erechtheus, Amphitrite for the frightened daughter, Aphrodite(?) for Procris, the Parthenon for the house of Erechtheus.

The statues of two women and a nude boy which came between the central action and Erechtheus, Furtwängler identified as other daughters of Erechtheus and Ion, the son of one of them. Ion was the youthful nude figure—see general scheme of arrangement above—which had usually been supposed from the drawings to be female. Dalton's etching represents this group better than Nointel's artist. In the *Guide* for 1925 it seems to be still represented as female, but as early as 1900 Miss Jane Harrison had written of this same figure: "It may be noted that figure 14, which a time-honoured interpretation calls Aphrodite in the lap of Thalassa, is undoubtedly *male*. I say undoubtedly, not because I think the evidence even of the original drawings conclusive, but because I do not believe there exists any Attic tradition which could make an artist of the date of Pheidias place a full-grown nude figure of a woman in a pediment composition. The nude male figure in the lap of mother or parent-city is natural enough." (See Fig. 1++ for nude figures.)

The subject of the west pediment, as explained by the Leake-Furtwängler theory, is one and simple, local and epic, and it must have appealed directly and deeply to every Athenian. Other attempts at explanation separated the spectators into two groups—supporters of Athena and of Poseidon—but as Miss Harrison long ago said, "there could be no division into opponent halves, that would have been religiously unorthodox." The images assembled there on the front of the temple were the founders of Athens, the patriarchs of the country. Cecrops and his family on one side, Erechtheus and his on the other, would have been pointed out as the Jews would have explained memorials of Abraham and Isaac and Rebecca.—"Those two there, up in the right-hand corner," were even as Jacob and Rachel. It is a loss to all of us who visit the Museum that generations go by and these deeply human meanings are hidden from us by vague nature impersonations which would have required a Baedeker to explain.

As Furtwängler said: "Pheidias, besides all his other qualities, was an artist for the people, since he was able to give form to that which was in the heart of every Athenian." Everything converges and combines to prove that the Leake-Furtwängler scheme of interpretation is right. There is, indeed, no other, except chance namings left over from old theories that no one believes in.

Restorations.—Of the great central group of Athena and Poseidon on either side of an olive tree, only a few fragments remain, but they may be well understood by comparing the drawing of 1674 with other representations of the subject (Fig. 4). In the

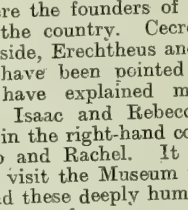

FIG. 4. COIN OF ATHENS.

Burlington Magazine, 1915, I offered a restoration of the Athena, based in part on a comparison of the remnants with the statue which Furtwängler identified—I think rightly—with the famous Lemnian Athena of Pheidias. His theory has not been welcomed in England, but many Continental scholars, from Michaelis to Lechat, have accepted it. The latter writes (1924): "Furtwängler's hypothesis, although not unanimously accepted, has the highest degree of likelihood. . . . This adorable head."

(*To be continued.*)

THE ROME SCHOLARSHIP EXHIBITION

THE report of the Faculty of Architecture on the designs submitted for this year's competitions states that for this examination of the designs they looked for:—

(*a*) The effective grouping of the subsidiary buildings in relation to the central building, the embankment and bridge approach.

(*b*) A satisfactory relation in scale of all the parts, and buildings of a practical and suitable character.

(*c*) Evidence on the part of the competitor of general competence in architectural technique.

The Faculty are of opinion that the work submitted is of a higher standard than in recent years. After careful examination they state that the design of Mr. R. P. Cummings ("Konk") (Architectural Association) is the best submitted, and they recommend that this candidate be awarded the Rome Scholarship. They place second the design of Mr. H. T. Dyer ("Melrose") (London University), and recommend that, if he be eligible, he be awarded the Jarvis Studentship offered by the R.I.B.A. The Faculty further recommend that in view of the merit of their work Mr. J. B. Wride ("Faustina") (Cardiff Technical College) and Mr. M. S. Smith ("Mono") (London University Atelier) be admitted direct to the final competition for the scholarships of 1928.

THE drawings make a remarkably good show. The winner of the Rome Scholarship probably deserves his place, though there is not a fine dominating quality anywhere in the group, such as we find in No. 26, which has a well-designed dome as the dominating feature. "Konk," the winner, has produced a monumental and well-proportioned design, which would lend itself to the use of ferro-concrete in a very satisfactory way. His great exhibition hall is a huge building with elliptical-shaped vaulting ribs. The plan is well laid out, with easy and clear access to all parts.

The Jarvis Studentship is, we feel, a better laid out scheme and would make a fine and telling group of buildings. The author, "Melrose," follows a classic tradition, and except for the too close arrangement of columns has obtained a distinctive and telling emphasis. There is more of an actual approach to grandeur of design in the design No. 28, in its ably designed central dome. The design No. 29 is another scheme after the manner of "Konk," and the central pavilion is a striking feature. No. 22 has a good air of dignity in the central part; and No. 20 has also some distinct merit. The designs as a whole are a very encouraging performance.

It would be impossible to find a better subject for fine imaginative design than that set for the present Rome Scholarship competition—the creation of a group of buildings to exhibit and symbolise the resources of a great empire; an ample level site approached by a bridge over a stream was to hold a group of buildings for assembly and exhibition halls and, unlike nearly every problem the architect has to face, no limit of cost. The architect confronted by the stern matter of actual practice does not get this sort of chance to let himself go. But in the very width of opportunity lies a snare for the designer, and no great success is to be attained without a due feeling of restraint and a careful avoidance of merely ostentatious display of features and ornament. In the subject of an Imperial display there may doubtless be an economy of effort, but it must be accompanied by a generosity of handling which shall symbolise prestige and resource. It is not possible to judge what the full effect of a large group of buildings will be without a perspective view giving the value of masses and the general sky-line of the group, and distinction of emphasis by mouldings and ornamen Seen under the test of perspective we c imagine the winner of the Jarvis stude ship scholarship would present a more i pressive solution of the problem than t winner of the Rome scholarship. Adm able as are the drawings of the vario designs, they fail to present a full reali tion of the whole schemes.

Amongst the work of other students, so beautiful drawings by C. A. Minoprio, the Basilica of Constantine, and others fr Siena and Rome, are a pleasurable addit to the Exhibition.

One can hardly feel that a high stand of decorative instinct is found in the dec tive painting, clever as some of the work The subject of the designs is not, perha a happy one.

Probably, from the sculptor's point of v the award in sculpture may be conside right, but there can hardly be any doubt t the architect would see in the general fo and design of No. 16 a more satisfactory c position than in the winning design.

NEW DIOCESE OF DERB

THE following passages occur in the co of a message to those concerned in the es lishment of the new diocese by the Bis of Southwell, and are taken from "Souvenir of its Foundation," edited Canon A. W. F. Blunt:—

"By a clause in the Measure which au rised the division of the diocese of So well, All Saints' Church has become Cathedral Church of the Diocese of De Already an effort is being made in some gree to fit the church for its new immensely important purpose; and I ima that, when the present scheme of enrichn is completed, some few years must necessa elapse before any further provision is m It is, however, hardly likely that the nee the Diocese can be permanently served by present cathedral, and the time will assur come when the choice will have to be m between an extension of the present buil and some larger scheme. When that comes, I should hope that the Diocese w be willing to face the possibility of doi new thing—new, at least, for many ge tions. What I have in mind is the cre of a cathedral adequate for the very large gregations which assemble from time to in all cathedrals on great diocesan national occasions, but not as vast as of the cathedrals of the past; and so desi and equipped as to be—wholly—a 'thi beauty.'

"Liverpool has set itself the task of b ing an immense cathedral, and has entr the work—in the main—to one man. honour to Liverpool for its wonderful e prise. But might not Derby, in days to follow another course—not less laudable build a cathedral sufficiently large for its pose, but small by comparison with mo our cathedrals; and, in the matter o actual fashioning of the cathedral an furniture, might not a serious attemp made to plan a co-operative effort in architect, artists, and craftsmen of v types might join forces? for no singl dividual can really aspire to supremacy the arts and crafts which go to the fa ing of a complete cathedral.

"What I have in mind is a fellows architect, sculptor, painter, metal craft stained-glass artist, embroiderer—and p others—all eminent in their respective sp who should be gathered together and co-operate to produce what is at prese known: a cathedral in which not only each detail be planned with reference whole, but *everything*—from the bu itself to the hinges of the doors, fro altar to the hassocks—should be wor its place in a temple built in honour God of beauty. . . ."

SECONDARY SCHOOLS—III

By T. P. BENNETT, F.R.I.B.A.

(*Concluded from page* 662.)

PUBLIC ELEMENTARY SCHOOLS.

The whole of the general principles set
vn for secondary schools apply to elemen-
y schools, modified by the differences in
ages of the scholars for whom they are
ended and by the lower standard of edu-
ion expected. This is principally evi-
ced in planning by larger classrooms and
substantial reduction in the amount and
portance of the subsidiary accommodation.
ce about 1914 there has been an increasing
dency to design single-story schools, and
n in town areas where the site is so
tricted that this is not possible the aim
been to create the maximum amount
playing space, and with this in view the
f becomes a playing ground as well as
site surrounding the buildings. Schools
at present governed by the Board of
ucation Regulations issued in 1914 and
rinted in 1921; and the history of the
elopment of elementary schools will be
nd in the standard work by Felix Clay.

Special schools " show in some direc-
ıs a tendency to decrease, *i.e.*, there are
schools for so-called backward scholars,
in other respects schools are still pro-
ed for children with consumptive tenden-
and other ailments. The " open-air "
ool, of which there are examples in Derby-
e, Bristol, Kettering, and other places,
proved to be a movement receiving wide
port. The central school having a definite
s to trade, science or commerce occurs in
ıdon in addition to the elementary and
ndary schools.

he principal items of accommodation in
ientary schools are as follows:—

rea of Site.—A quarter of an acre is
ıired for every 200 pupils, but if a roof-
ground is provided this may be reduced.

laygrounds.—For under 200 children
0 sq. ft. are required in addition to
sq. ft. for every senior child and 6 sq. ft.
every infant. For over 200 scholars
sq. ft. are required per older child and
sq. ft. per younger child. Where pro-
on for playing fields exists the basic
res given above are altered to 10 sq. ft.
6 sq. ft. in the first case, and to
q. ft. and 16 sq. ft. in the second case.

epartments.—A single department should
contain more than 400 pupils. Separate
artments are recommended for boys and
, and in the case of urban districts for
, girls, and infants. The regulations of
Board give a number of examples of the
nisation of the building in regard to the
ber of scholars to be taught for various
and districts.

alls.—The area required is 3½ sq. ft. per
l of the number for which the school is
gnised, and, except in special cases, the
imum area is to be 1,500 sq. ft. Where
e are a number of young children a
rate hall or playroom is considered
ssary. Small schools with children of
ly different ages require rooms where
teacher can sub-divide the class into
ps, and for this a room is more satis-
ory if rather longer than the ordinary
room.

assrooms.—The area required per pupil
0 sq. ft., except for those under 7 years
ge, where 9 sq. ft. is sufficient. Where
separate playroom is provided for the
ger children, it is necessary for their
room to have 12 sq. ft. per head and to
tted with light movable chairs and tables.
only variation in the regulations for the
of classrooms, etc., which differs from
of secondary schools, is the regulation
h provides a gangway between of
4 in. in lieu of 1 ft. 6 in. Door panels
d be glazed to facilitate supervision.
nty inches of desk space is required for each older child and 18 inches for each younger child, the details of the desks being subject to the approval of the Board of Education. It is recommended that the height of the desk should vary according to the age of the scholar, but this regulation would appear to make it necessary to set apart a classroom for the exclusive use of each class.

Cookery School.—Twenty-five square feet per scholar are necessary, with an addition of 5 sq. ft. approximately per head for fixed apparatus. This room should have north aspect and special arrangements for ventilation and warming. The remaining regulations are similar to those for secondary schools.

Laundry Rooms, or " Centre."—A similar area per pupil is necessary as for a cookery school. A copper with a capacity of 12-18 gall. must be installed, and sinks, draining boards, 6 ft. of table space per head (2 ft. 6 in. wide), and arrangements for proper drying (where this has to be provided indoors), are other important provisions. It is further proposed that combined rooms for domestic subjects should reproduce, as far as possible, the accommodation of a modern house or flat, with a large room attached for theoretical work. Such provision has been made in some instances.

Drawing Studio (for advanced drawing).—30 sq. ft. per scholar.

Science Room.—20-25 sq. ft. per head with simple benches. Both the above are subject to the Board's approval.

Staff Rooms.—Teachers must be provided with staff rooms and accommodation for cloaks, lavatories, etc. Lavatories and w.c.'s for women teachers must be provided in the main building. It is sometimes desirable to allow provision for teachers' bicycles.

Rooms for Meals.—Where mid-day meals are provided a separate room must be set apart for the purpose, and a kitchen preparing 100 meals per day must have an area of not less than 200 sq ft. In country or other districts where a large number of children bring their meals, accommodation should be provided for them to eat such meals, and arrangements may be made for heating food.

School Medical Officer's Rooms.—These may be necessary in large schools.

Cloakrooms.—The provisions are similar to those of secondary schools except that pegs are in two rows placed zig-zag; for boys 12 in. apart in each row and for girls and infants 18 in., giving a lineal spacing of 6 in. and 9 in. respectively. Cloakrooms must be capable of being locked, and frequently have doors constructed of expanded metal or collapsible gates.

Lavatories.—Basins are required at the rate of one for every 25 pupils.

Baths.—Where other facilities for cleansing children are non-existent, spray baths may be installed. They should be sufficient to allow 12-20 children to use them at one time, and should include simple dressing boxes, a store for towels, and a drying chamber.

Closets.—The regulations for these are similar to those for secondary schools, but the number required are as follows:—

No. of Children.	Girls.	Boys (in addition to urinals).
Under 30	3	1
,, 50	4	2
,, 70	5	2
,, 100	6	3
,, 150	8	3
,, 200	10	4
,, 300	14	5
,, 400	18	6

In blocks of offices common to infants of both sexes there must be urinals which, with closets, must be partitioned off from the younger girls' w.c.'s. If the number of infants is small, blocks may be common to older girls and infants, but a proper proportion must be made suitable for children under eight years of age. Earth closets of approved type may be used in country districts, but drains for slop and surface water will still be necessary.

Urinals.—Must be separate from closets, and should provide 10 ft. run per 100 boys.

Drains.—The regulations of the Boards for 1921 give, in an appendix, extensive information as to the way drains, etc., are to be laid, and other information with regard to earth closets.

Teacher's House.—If a house is to be provided it must be planned as a private residence, having its own offices and yard, and with no internal communication with the school. It should consist of at least the following: Sitting-room, kitchen, scullery, bathroom, 3 bedrooms.

Ventilating, Heating, Lighting, Construction, and Materials.—The provisions of the Board with regard to these are similar in all respects to those for secondary schools.

EXHIBITION NOTES

The Royal Institute of Painters in Oil.

There are a few pictures of definite charm at the Royal Institution galleries, though the average quality is really very poor. We are at once attracted by the landscape of " La Pernelle, Normandy " (376), by Leslie Thomson, which is a fine impressive picture, most pleasing in tone and colour. We have often admired the pictures by this artist for their refined and poetic treatment, but this fine landscape seems to be about the best of anything he has done. If we look into the painting carefully we may note the artistry with which it is composed and painted. It has a real life, created from a genuine appreciation of the beauties of nature. The charm of lighting on the ascending road, the mysterious depth of the nearer hill, the effective alternations of light and shade, and the admirable breadth and keeping of the whole picture, make up a real accomplishment of landscape art. We may next refer to Arthur Severn's " Westminster from Charing Cross Embankment " (343); this, in some respects, is as good as anything he has done, in its charm of gold and grey: the only drawback is the unfortunate punctuation of the bare trees and the Parliament buildings, for a little more care in the drawing would have given an added value. A perfect picture of its kind is the " Sunset, Dordrecht " (322), by Moffat Lindner. This, and Tom Robertson's " Ruins of Bluebeard, Castle Chauptocé " (332), are the best pictures of a decorative kind in the gallery; they present a great contrast in colour, but they both possess the valuable qualities of breadth and keeping, and should have a lasting charm. " The Afterglow " (282), by Julius Olsson, is a masterly representation of the afterglow over tossing waves; it is an admirable work. " The Tranquil Eve " (92), by Sir David Murray, is a sweet little low-toned picture, in fuller notes of colour than this able painter usually gives us. Padovick's Southern landscape (263) is a telling piece of broad, strong work: a well-composed landscape. Leonard Richmond has a brilliant passage of colour in his " Etaples " (260), and another powerful effect is a Canadian scene, " Lake O'Hara " (139). There are a certain number of other pictures which merit attention, but it seems to us that the chief value of the exhibition is summed up in the works we have mentioned.

Association of Public Lighting Engineers.

All communications to this Association should in future be addressed to 68, Victoria-street, S.W.1.

THE LONDON BUILDING ACTS AND THEIR APPLICATION—XXXIII

By H. V. MILNES EMERSON, A.R.I.B.A.

SECTION 170.—Under this section the Council may demolish buildings and sell materials and recover expenses where any person has been convicted of an offence against any of the provisions of any part of this Act, or any by-law made thereunder, if such person has made default in complying with the Order.

SECTION 171.—This section provides for procedure by local authorities in case of buildings in advance of general line.

SECTION 172.— Provides for payment of surplus of proceeds into Court.

SECTION 173.—Where it is by any provision of this Act, declared that expenses are to be borne by or may be recovered from the owner of any premises (including under the term "owner" the adjoining and building owners respectively) the following rules shall be observed with respect to the payment of those expenses :—

(1) The owner immediately entitled in possession to the premises, or the occupier thereof, shall in the first instance pay the expenses with this limitation that an occupier shall not be liable to pay any sum exceeding in amount the rent due or that will thereafter accrue due from him in respect of the premises during the period of his occupancy.

(2) If there are successive owners each of them shall be liable to contribute to the expenses in proportion of his interest.

(3) Any difference arising as to the amount of contribution shall be decided by arbitration.

(4) If some of the owners liable to contribution cannot be found, the deficiency so arising shall be divided among the owners who can be found.

(5) Occupier of premises, who has paid any such expenses, can deduct the amount from rent payable by him, etc.

(6) Expenses can be recovered in a summary manner in case of default, etc.

It has been held that where a building held on lease has been condemned as dangerous that proceedings must first be taken against the lessee and not the owner for the recovery of dangerous structure expenses. Mourilyan *v.* Labalmondiere, 25 J.P. 340, 30 Z.J.M.C. 99 (1861).

The expenses can be recovered from one co-owner of a party-wall, who in turn could recover the contributions due from the other owners. Debenham *v.* Metropolitan Board of Works, 43 L.T., 596 (1880).

In *The Builder*, March 28, 1903, will be found a report of the case, Cane *v.* Robinson. The owner who occupied the ground floor of the premises sought to recover the cost of pulling down and rebuilding the dangerous party wall, from the lessee of the upper floors, but it was held that the condition of the ground floor portion of the wall being the cause of the removal of the whole of the wall, costs could only be given for the pulling down of the wall and not for rebuilding same.

SECTION 174.—This section provides for an extension of 28 days for the period within which sanction or refusal is to be given by the Council for matters under Parts II. or V. of this Act, if such period would expire between August 8 and September 14.

Section 7, 1905 Act, provides that the period of one month for consent or refusal shall be extended to two months, when the commencement or expiration of the notice commences between August 1 and September 14.

Tribunal of Appeal.

SECTION 175.—For the purposes of this Act a Tribunal of Appeal shall be constituted as follows :—

One member appointed by a Secretary of State.
One member appointed by the R.I.B.A.
One member appointed by the Surveyors' Institution.

Section 25 of the L.C.C. (General Powers) Act, 1909, states:—For the purposes of this part of the Act the Tribunal of Appeal shall consist of the three members of the Tribunal of Appeal from time to time appointed under Section 175 of the London Building Act, 1894, and of one member appointed by the Council of the Institution of Civil Engineers. In the event of there being an equality of votes on any matter arising under this part of this Act, the Chairman of such Tribunal shall have the casting vote.

SECTIONS 176 to 186 inclusive deal with matters relating to the Tribunal of Appeal. Section 182 provides for the Tribunal to state a case for opinion of the High Court if required, and Section 183 provides for the procedure of the Tribunal to hear and determine appeals from :—

Decisions of the Council under Section 13, sub-sections 3 and 4, position of new buildings with reference to streets.

Section 19, refusal, etc., under Part II. of this Act to the formation or laying out of a street.

Section 41.—Space at rear of domestic buildings, etc.

Section 43.—Refusing to permit deviation from plans of buildings previously existing upon the site.

Section 44.—Laying out new streets on cleared area.

Section 48.—Refusing to consent to the erection of a building to a greater height than prescribed by the Act.

Section 122.—Dwelling-houses on low-lying land now substituted by Part III. of the L.C.C. (General Powers) Act, 1920. Section 7.

Section 139.—Dealing with powers of Council as to surveyors and districts.

Decisions of the Superintending Architect :—

Section 5, sub-section 8, defining what is the "level of the ground."

Section 25.—Appeal against certificate of architect as to general line under Section 22.

Section 29.—Defining in what street a building or structure is situate.

Section 46.—Defining front or rear of building.

Decisions of Chief Engineer :—

Section 7 L.C.C. (General Powers) Act, 1920, replacing Section 122 of this Act. Dwelling-houses on low-lying land.

Decisions of a District Surveyor :—

Section 5, sub-section 8.—"Level of the ground."

Section 13, sub-section 5.—Refusal to certify plans of existing buildings.

Section 19.—Refusal, etc., of certificate under Part II. of this Act.

Section 43.—Refusal to certify plans of existing buildings.

Section 78.—Construction of public buildings.

Section 79.—Conversion of houses, etc., into public buildings.

Section 132.—Appeal against refusal of certificate relating to "sky signs."

Appeals to the Tribunal can also be made under the London Building Acts (Amendment) Act, 1905, as follows :—

Sections 7, 9, 10, 11, 12 and 13.—Relating to protection against fire in certain new and existing buildings, projecting shops, means of access to roofs, rules for living-rooms over premises used for storage of inflammable liquids and conversion of buildings.

CORRESPONDENCE

Model Dwellings.

SIR,—Model dwellings, during the pres housing shortage, no doubt fill a very u tarian purpose, but the best of them are pellent; their commonplace design barrack atmosphere are not conducive to finer feelings of their best inhabitants. these places are not architectural gems, least some care could be bestowed on t interior conveniences. Some that are ere in London have the lavatories in the b rooms—an awkward condition of affairs a mixed adult family; apertures of shoots on a level with feet, etc.

Seeing that under the present condit these places are being rapidly erected, a formal chat with an intelligent model dw would be helpful and simplify matters.

CHARLES MATTINGL

A Mediæval Ventilator?

SIR,—You may be interested in the closed photograph of a ridge tile and ornament, which, dating from the thirte to fifteenth century, was recently foun the foundations of an ancient church in city. It has been submitted to the Br Museum for expert advice, and is now lieved to have been used for ventilation.

this is so it is unique, and the earliest of ventilation that is known.

F. C. MORGAN,
Librarian, Public Library, Mu and Art Gallery, Herefor

Deviations from Contracts.

SIR,—In settling up a contract which, on bills of quantities, has been exte modified while being carried out, what usual procedure with material which ha obtained but not used?

This query refers particularly to which, from their special nature, can returned to the manufacturers and therefore be taken into stock by the c tor. Even should this material prove it will probably have to be stored fo years and consequently suffer the usu terioration.

It appears that a fixed percentage all should in fairness be allowed, but I think this practice is usual. General questions are left to the tender mercies architect or surveyor who, when settl is generally guided by considerat whether the total account is likely to the original tender or not.

The way of dealing with such it various districts would be of intere

SETTLIN

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—Ed.

Damp Chimney Breast.

[Reply to "Nonplussed," October 28.]

Sir,—The dampness that shows on the faces of chimney breasts may originate in several ways. If it is continuous from the exposed parts of the stack to below the ceiling level of the topmost story, there is good reason to suspect that driving rains soak into the porous brickwork above roof level, and the moisture then gravitates until it shows in the room below. In such a case the obvious remedy is to prevent the ingress of the rain by rendering the outer surfaces of the stack with waterproofed cement.

The dampness that sometimes results from defective flashings need not be dwelt upon, because the cause and remedy are usually apparent, but it may not be out of place to put in a word for the old-fashioned custom of setting a course of bricks oversailing, just above the level of the slating or tiling, and weathering the top of this oversailing course with a cement fillet, so that the rainwater is thrown clear of the face of the stack. This precaution is especially desirable in cases where the usual lead aprons and skeleton cover flashings are omitted, as sometimes happens, because of an objection to their appearance.

There is another cause of dampness which seems mysterious in its origin, because it appears in an isolated patch upon the face of the chimney breast below ceiling level. It will generally be found that this patch of dampness coincides with the "ramp" of the flue where it is gathered over to join the others before the stack emerges from the roof. When an open chimneypot is used, the rain that falls down the flue strikes this sloping face and then soaks through to the inner surface of the breast. The remedy, usually effective, is to fix a chimneypot such as the "Edwardian," which has side outlets, and so prevents rain falling down the flue. A half-round ridge tile put over the flue with the closed sides facing the prevailing winds is often equally effective.

If it is difficult or inconvenient to get at the chimney stack to apply any of the measures indicated, the rendering over the damp face of the chimney breast with waterproofed cement, and finishing off with gauged setting stuff to prevent condensation, will keep back all signs of dampness and counteract its ill effects; but obviously the best method of dealing with any problem of dampness is to trace it back to the original cause, and, if possible, remove this.

L. E. Walker.

Sir,—The probable cause of the trouble is the absence of a dampcourse to the upper part of the chimney. I should suggest treating the outside surface with a good petrifying solution.

Waterproof.

Ownership of Documents.

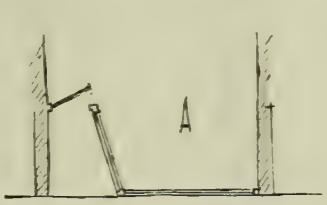
[Reply to "Lancashire," October 28.]

Sir.—There does not appear to be any case reported bearing on the points raised in the query. Under the Copyright Act, 1911, an author of work in the employment of some other person under a contract of service who makes that work in the course of his employment is not the first owner of the work. In the absence of any agreement to the contrary the person by whom the author was employed is the owner. If, however, as is stated, there was no copyright in the plans, although the action of the clerk of works was not justified, it is useless to attempt to obtain any redress for making tracings of them "on his own tracing paper." But, in respect to the note-books, diary, letter-book, etc., though the books themselves were provided by the clerk of works, the matters they contained were put in them by the clerk of works in the course of his employment; and the employer owns them, and can sue the clerk of works for their possession. In this case the clerk of works can claim the actual cost of the books, etc., provided by him at his own expense.

Law.

Teak Table Tops in Chemical Laboratories.

[Reply to H. M. Cautley.]

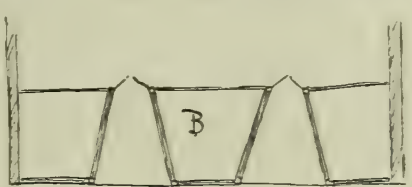


Sir,—Teak tops for tables are the best. We have recently fitted an up-to-date lab., and after the work was completed the "lab. boys" rubbed the tops over with linseed oil and polished with Ronuk. All our tables are done in this way throughout the science department with excellent results; but, like most things, they must be looked after and rubbed over every day the labs. are used.

W. S. K.

Wellington, Berks.

Reflections in Plate-glass Windows.



Sir,—We are troubled by reflection occurring in the plate-glass windows of shop-fronts. In the first instance (Sketch A) the shop

Shop Front Level with Face of Building Above.

stands opposite an intersecting road, and an excellent perspective of the road always appears in the window. This reflection appears until one is close up against the window, and to get a photograph showing anything but the reflected roadway is impossible. There is no window back.

In the second instance (Sketch B) there

Shop Front Projects from Main Building and has a Flat Roof.

are window backs. Can you suggest a reason for the reflections and a remedy?

Alfred King & Son.

Work Exceeding Estimated Cost.

Sir,—A builder enters into a general building contract (R.I.B.A. Conditions of Contract) to carry out extensive structural alterations to an existing building in accordance with plans, specification, and details prepared by an architect—to whose satisfaction and under whose supervision the work is to be carried out. Included in this contract are provisional sums for works to be executed by sub-contractors. Amongst these subcontracts is one for electric lighting, secondary lighting, electric heating, electric fittings, and service bells. Certain sums have been allocated for each of the above and referred to in the contract, viz., in the "Specification Estimate and Schedule of Prices" which form the basis of the contract in the following form:—

"*Item A.*—Provide the sum of £———— for electric lighting system which will be installed by an approved firm of electrical engineers."

"*Item B.*—Allow for attendance, cutting away for and making good after, on electrical engineers (average 50 points to each of the five floors), use of scaffold, ladders, plant, etc., add for profit and making good any damage that may occur."

This last item was priced out by the builder at so much per cent. on the blank sum referred to in Item A.

The work is proceeded with in due course, and shortly after the contract is signed, estimates are obtained from a firm of electrical engineers, which are nominated by and approved by the architect, and the builder accepts these estimates on the architect's request. During the progress of the general building contract the builder from time to time provides attendance on the electrical engineers, and performs "cutting away for and making good, etc.," in accordance with the terms of the contract.

When the work is fairly well advanced, the builder discovers that the percentage estimated and provided by him in "B" is not sufficient to meet the cost of the "cutting out and making good" required. The builder, however, proceeds with the work, and when the work is nearing completion he calls the architect's attention verbally to the high cost of the "cutting out and making good," which represents a much higher figure than that provided by him, and sends to the architect daywork sheets showing particulars of labour and materials; at the same time asking him to certify for same. The architect refers him to the terms of the contract as embodied in items "A" and "B," at the same time stating that he cannot accept those daywork sheets for the following reasons, viz.: that they are contrary to the terms of the contract, and although not mentioned, in any event they were not sent in weekly for examination and comment, but adding a rider to the effect that he is quite prepared to review them at the completion of the contract in the light of any special circumstances which may be applicable to such a case.

Expresion of opinion is asked for on the following points:—

(1) Do items "A" and "B" clearly define the duty and liability of the builder?

(2) Is the architect's attitude correct, in refusing to certify any sum beyond the percentage provided in item "B," of course subject to the rider above?

(3) Is the builder entitled to ask for the percentage provided by him in item "B" to be put on one side, and to ask for payment on daywork sheets in lieu of same, and if so, under what circumstances? This opinion would be useful if the rider is applied.

Notes.—(1) The provisional amounts provided in the contract and the amounts expended in connection with them are practically the same. The question of any possible excessive cost in cutting out and making good due to considerable increase of expenditure over amounts of provisional sums does not arise.

(2) The builder had access to and was requested to visit the premises to see the nature of the work before submitting his tender.

(3) No additional points have been put in.

Ajax.

[Our correspondent has put the matter clearly and supplied in his notes all the answers to questions that usually arise in these instances; therefore we can answer his questions categorically:—

(1) Answer, yes.

(2) Answer, yes.

(3) Answer, no. In view of the notes (1), (2), and (3) which have an important bearing on the general question, we would add that chapters iv. and vii. of "Creswell on Building Contracts" (obtainable at our offices) will assist our correspondent.—Ed.]

THE BUILDING TRADE

BUILDING CONTRACTS

By W. T. CRESWELL, Barrister-at-Law, L.R.I.B.R., Assoc. (late Fellow) Surveyors' Institution.

Provisional Amounts.

At the settlement of accounts of most building contracts differences more or less acute arise in the determination of the amounts due to the builder for labour, materials and attendances, etc., in connection with work done by specialists for provisional sums named in the contract documents.

There is a very general opinion that whatever the law may be on this matter, it is not always the best plan to stand rigidly by it, but rather, relying on a sound technical knowledge, to arrive at an amicable settlement of the difficulty. Be this as it may, architects and builders will find very useful a general and sound acquaintance with the principles of law involved; as this knowledge will materially help to avoid disputes as well as to settle them, when they arise, in a friendly manner.

Where the schedule of prices is made part of a lump sum contract, the matter is more easily dealt with, provided the descriptions of both the provisional amount and what is to be done by the builder thereto are sufficiently lucid to show precisely what is intended.

In such cases, it is not an unusual method to extend the provisional sum with an addition of, say, 10 per cent. thereto; this percentage being the full remuneration to the general contractor for his work, etc., in connection with the provisional item and the responsibility for the protection and completion of work done under provisional sums by sub-contractors, which is mostly placed upon the general contractor.

Where There is One General Contractor.

It must be borne in mind that the primary object of the inclusion of a provisional sum for work done by specialists is to simplify matters for the employer by arranging that he may have one general contract, and one contractor; and so avoid a multiplicity of liabilities and other complexities naturally resulting if there are several contractors. The provisional sum in fulfilling that object must always be regarded as an approximate sum for the particular work for which it is provided.

In Hobbs v. Turner, 1902, 18 T.L.R. 235, the Master of the Rolls said: "It was good sense that a sum should be fixed for each class of work which was not to be executed by the builder, but by some tradesman or artist designated by the architect."

Remuneration of the Specialist.

The specialist is generally employed by the general contractor, to whom he must look for his remuneration; because in general there is no privity of contract between the employer and the specialist. Nor can an employer withhold payments due to the general contractor under the contract and pay them direct to the specialist, unless the contract provides for this manner of payment, since there is likewise no privity of contract between the employer and the specialist.

The provisional sums form additions to, or deductions from, the amount of the contract depending on whether the work contemplated to be included therein is wholly or partly executed or omitted altogether.

In Young & Co. v. White, 1911, 28 T.L.R. 88, Coleridge, J., said: "Generally, if the specialist supplies the goods or does the work for less money than the provisional sum allowed for prime cost, the owner gets the benefit, and is entitled to a deduction on the whole contract accordingly. If the specialist charges more, the extra amount is added by the builder, and is an extra on the contract. This shows that the owner gets the benefit or suffers the loss of any lesser or greater amount payable in respect of the prime cost. This does not affect the right of the contractor to his profit on the whole contract, which would probably include this item."

Avoidance of Disputes.

To avoid disputes the contract clauses should be worded so as to define clearly what it is intended that the various provisional sums shall include or cover, as well as the method to be followed in the settlement of accounts in respect to such items as returning empties, carriage, profit, fixing and attendance, cutting away, etc.

If, as should always be done, a complete list of the provisional amounts is given at the beginning of the specification and bill of quantities, then intimation is there given of the allowances to be added to the provisional sums.

Another method is to name profits which are included in each of the provisional sums respectively, and, indeed, if no express details are given, it must be taken that the allowances are included in the provisional sums stated; although in the case of "p. c." or "prime cost" amounts (they being for small items, e.g., locks and furniture), if the contractor has not been asked to state his profit he should add a sum in each case for his profit and the labour in fixing to the net price paid for the article required.

Adjustments of Accounts.

In adjusting provisional sums, it is generally understood that the surveyor is entitled to require for his personal inspection all original invoices, and if, due to only part of the work being done or some cheaper article used, only a fraction of the provisional sum has been expended, then the contractor is allowed the same fraction of the profit, etc., which he gave in the schedule of prices; and if, on the other hand, a sum greater than the provisional sum is spent, then the excess he is entitled to demand is an "extra," and not governed by the schedule unless the latter specially provides that it shall be so governed. If the contract provides for net deductions of provisional amounts, then net amounts only are deductable, that is to say, the profit added by the contractor is payable to him and is not affected by this deduction.

DEPARTMENTAL CONTROL AND SPECIAL TRIBUNALS

The President of the Law Society, at the Meeting of the Society at Sheffield, in his presidential address, drew attention to, and entered a protest against, the tendency in modern legislation to create tribunals of an extra-legal character, and he instanced the Acquisition of Land (Assessment of Compensation) Act, 1919, section 84 of the Law of Property Act, 1925, and the Landlord and Tenant (No. 2) Bill, and he referred to the attitude of the judges in protecting the subject from invasions of their rights by the executive Government as a great safeguard to liberty. Later on in his address he deprecated the provisions in the Bill in connection with proceedings by or against the Crown which made civil servants, and not the judges, the sole judges of the accuracy of an assertion that documents in the hands of the Crown could not be disclosed without injury to the public interest. There is great weight in these observations, for now over a considerable period of years two tendencies have been apparent in modern legislation—first, to give the heads of Government Departments undue powers; and, secondly, to set up special tribunals for all kinds of purposes.

As regards the first point, we may quot from some observations of the Lord Chie Justice in a case under the Rating and Valua tion Act, 1925 (Rex *v.* Minister of Health 1927, 2 K.B. 229): "I should like to add tha there is a very remarkable provision in th Statute which may interest those persons, i there are any, who observe the progress o departmental authority. Section 67, sub section (1), provides: 'If any difficulty aris in connection with the application of this Ac to any exceptional area, or the preparatio of the first valuation list for any area'—thes words are of remarkable comprehensivenes —'or otherwise in bringing into operatio any of the provisions of the Act,' the Ministe of Health may do a series of remarkabl things. He 'may by order remove th difficulty.' The imagination fails to co template at one view the extent and variet of the power which is given to th Minister under those words. He may cu the Gordian Knot in any way that seem best to him, he 'may declare any assess ment committee to be duly constituted he may 'make any appointment or do an other thing which appears to him necessar or expedient for securing the due preparatio of the list or for bringing the said provisio into operation.' The legislature, not conte with arming the Minister with these remark able and varied and far-reaching powers, go on to provide that 'any such order ma modify the provisions of the Act so far may appear to the Minister necessary or e pedient.' For what purpose? For carryi the Act into effect? Not at all—'for carr ing the *order* into effect.' This, I thin though I say it with some hesitation, may b regarded as indicating the high-water ma of legislative provisions of this character."

The Lord Chief Justice enlarged on th theme in an address he delivered in Canad and which will be found in an article writte by him for the *Times*, which appeared Sep tember 30, since this note was written.

Then, as regards special tribunals, the Pre dent of the Law Society expressed the opini that they would prove neither economic n satisfactory, and we dealt with this questi in our recent articles on the Landlord an Tenant (No. 2) Bill. The Law Courts act fixed and definite principles, and the decisio given are binding on all Courts of Concurre Jurisdiction. As questions are carried Courts of higher degree, the decisions of tho Courts bind all the rest, and when the Hou of Lords is reached, that decision can only altered by legislation. Special tribunals, ev if they are supposed to prove economic, gi decisions which may be compared with che goods which will not last.

Arbitrators may have no particular quali cations for ascertaining true facts out of t evidence of witnesses highly contradicto but taking the Landlord and Tenant Bill an example, their finding on fact will be co clusive, and, if litigants accept that tribun there is only one appeal to the High Cou which under the Bill appears to be a sing judge.

Thus matters of great complication invo ing very difficult principles of law will, the parties elect this tribunal, come to decided by a single judge; but the Law R ports show that on points connected with t law of Landlord and Tenant appeals fr Courts of first instance are exceptiona numerous, and the Courts of Appeal ha taken very different views on the law from t Courts of first instance, and the House Lords has repeatedly had to be consult until the principles of law were definitely l down by that tribunal.

Cheap justice, even if it is attainable at by special tribunals, will only result in multiplicity of litigation, as the loss of defi principles must result in uncertainty.

INTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—IV.

our last article we referred to the ques- which arises when a tenant holds over the expiration of an agreement or lease the terms on which he holds as a tenant year to year, but deferred a considera- f it.

rms upon which Tenants hold over.

we showed, if by the consent of both s a tenant remains in possession, and ng is said to rebut that inference, the ation is that there is a tenancy from c year on the terms of the old agree- or lease so far as they are con- t with such a tenancy. Dougal *v.* rthy (1893, 1 Q.B. 736). The law was stated on this question by the Court peal in the comparatively recent case edd *v.* Porter (1916, 2 K.B. 91) in clear to be as follows :—It is a question of in each case whether tenants holding do so on the terms of an expired lease t *v.* Griffiths, 1851, 7 Q.B., 505). If ue inference of fact is that the tenant over on the terms of an expired lease as applicable to an annual tenancy, a agreement to that effect is constituted w between the parties (Oakley *v.* Monck, L.R. 1, Ex. 159). Thus, if the facts do xclude an implied agreement to hold the terms of the old lease, then the law mines that the tenant impliedly holds ct to all the covenants in the old lease are applicable to the new situation v. Atkinson, 1815, 4 Camp. 275); but if the facts exclude such an implied ment, the law implies certain terms. In *v.* Porter by a lease dated October 11, a mansion house and farms had been to three persons for 14 years from mber 29, 1878, and the lease contained ants to repair, paint and maintain the ngs and fixtures to keep the walls, s and fences in repair and to cultivate nd in a husbandlike manner. The lease d September 29, 1892; one of the lessees ied before that date.

gotiations took place between the land- nd the two remaining lessees as to the of a new tenancy, but it was found at rial that the parties in the correspond- were agreed that the terms of the old should *not* apply, and that no new ment had been entered into except that should be a yearly tenancy at £850 a Another of the lessees had died in and the landlord had died in the same and in September, 1912, his executors the surviving lessee notice to quit. The ses had subsequently been conveyed to laintiff, and he had brought this action ecover damages for breaches of the ants in the lease and for breach of the implied in the tenancy. The import- of the case will be appreciated, for here clear that there was no express or d agreement that the terms of the old should apply to the new tenancy from to year, and therefore the terms to be d were only such as the law would

Court held that a tenant was under tion as implied by law to keep the ses wind and watertight, but not to ain and uphold" the premises orth *v.* Johnson, 1832, 5 C. and P., 239), o use and cultivate the lands in a ndlike manner, and according to the n of the country, subject to the pro- is of the Agricultural Holdings Act. the covenants which apply where a t holds over on the terms of the old by implied agreement, a list of these be found in any leading text-book ed upon old-established cases, but in these articles, as we have previously explained, we are confining our observations to fairly recent cases.

The Law where the Property has been Assigned.

A much more difficult question was raised in this case, which has also been the subject of other recent decisions, and with which we must now trouble our readers. It was contended in Wedd *v.* Porter that the plaintiff, being the assignee of the reversion, could not enforce this liability, as against the defendants, as there was no lease by deed containing express covenants, and therefore the provisions of 32 Henry VIII, c. 34, had no application. To this objection the plaintiff relied upon section 10 of the Conveyancing Act, 1881, contending that a writing not under seal would suffice. The Court of Appeal held that in this case the latter point did not arise, as there was no writing and no case for specific performance, and nothing to show that any instrument at all was ever intended to be executed or signed by the parties, but as regards the first point the Court held there was a distinction between express covenants and those implied by the law : the Act of Henry VIII. only applied to express covenants, and was directed to remedy the common law under which none but parties and privies to express covenants could be bound by or take advantage of them, but implied covenants stood on another basis. In plain language, the result of the finding was that the plaintiff could enforce only such covenants as the law implied, to keep the premises wind and watertight, but not the express covenants in the old lease, and only then for breaches which had occurred since the date of the conveyance to him, as the causes of action which had accrued in respect of breaches before the conveyance to the assignee did not pass by the conveyance to the assignee. The point under the Conveyancing Act was, however, decided in a subsequent case, Blane *v.* Francis (1917, 1 K.B. 252) by the Court of Appeal.

Section 10 provides "Rent reserved by a lease and the benefit of every covenant or provision therein contained having reference to the subject matter thereof, and on the lessee's part to be observed or performed and every condition of re-entry and other condition therein contained, shall be annexed and incident to, and shall go with the reversionary estate in the land or any part thereof immediately expectant on the term granted by the lease notwithstanding severance of the reversionary estate, and shall be capable of being recovered, received, enforced, and taken advantage of by the person from time to time entitled, subject to the term, to the income of the whole or any part, as the case may require of the land leased."

In that case by an indenture three cottages had been leased for a term of seven years from March 25, 1892, the lease providing that the premises should be kept in good and tenantable repair, and left at the expiration of the term in thorough repair. It is unnecessary to enter into all the details of the case, but on the determination of the lease the tenant, and on his death his representative, remained in possession without any agreement in writing. The tenancy from year to year continued until 1915, when it was determined by a notice to quit expiring March 25, 1915. In November, 1914, the lessors had conveyed the freehold of the cottages to the plaintiff and the tenant had paid the last half-year's rent to him. In this action the plaintiff, under section 10 of the Conveyancing Act, was seeking to recover damages for breach of the covenants contained in the lease to keep and deliver up the premises in repair, but the Court of Appeal held that the section only applied where there was an instrument in writing, and the defendant was holding under no agreement in writing and therefore was not entitled under the section to sue upon covenants contained in the lease.

This case must, however, be compared with Cole *v.* Kelly (1920, 2 K.B. 106; *The Builder*, March 26, 1920). There a Miss Hammond, who was the assignee of a lease for 10¼ years from December 25, 1912, by an indenture of lease dated February 24, 1913, had demised portions of the premises for five years from December 25, 1912, to the defendant, there being covenants in this indenture to keep the premises in good and tenantable repair, and to deliver them up in the same condition. Miss Hammond died in October, 1914, and in November, 1917, her administrators, before the termination of the term granted to the defendant, had agreed, by an agreement contained in letters, that on the expiration of the term the defendant should continue to occupy the premises on a quarterly tenancy subject to a quarter's notice on one of the usual quarter days. On June 20, 1918, the defendant gave notice of her intention to quit on September 29, 1918. On July 10, 1918, the administrators had assigned to the plaintiff the residue of the term granted to Miss Hammond by the head lease, less three days, but with the benefit of the lease dated February 24, 1913, under which the defendant had originally held.

The defendant gave up possession on September 29, 1915, and on October 8 the plaintiff brought this action to recover damages for breach of covenants to repair under the expired lease of February 24, 1913. The Court of Appeal held that there was an agreement here in writing for a quarterly tenancy, and the terms of the expired lease as to repairs were to be implied in it, and these terms were therefore "contained" in the new agreement within the meaning of section 10 of the Conveyancing Act.

We gather from these cases that where a tenant holds over after the expiration of his original tenancy and no arrangement is made as to the terms on which he continues on, except as to the rent to be paid, then an assignee of the reversion can only sue him for a breach of such covenants as the law implies (Wedd *v.* Porter), and to bring the case within section 10 of the Conveyancing Act, and thus to enable an assignee of the reversion to sue upon the covenants contained in the lease under which the tenant held over, there must be an agreement in writing from which at least it must be capable of being inferred that the terms of the expired lease are to apply to the tenancy from year to year (Cole *v.* Kelly).

The lesson to be drawn from the above consideration of the cases appears to be that where a tenant holds over the landlord should be careful to put in writing, agreed by both parties, the terms upon which it is intended he shall continue on as tenant. In yearly tenancies it may, of course, suffice to allow the tenant to continue without such an agreement, as in such tenancies there are rarely stringent provisions as to repair, and the covenants implied by law may suffice, but in all longer terms the points we have indicated are very important.

Section 10 of the Conveyancing Act, 1881, is now represented by section 141 of the Law of Property Act, 1925, and that section also incorporates section 2 of the Conveyancing Act, 1911, which relates to conditions of re-entry or forfeiture for breaches of covenant which had become enforceable before the person seeking to enforce them had the property conveyed to him, but we do not think that the new statute effects any change in the law as stated in the above cases, except that the section now applies to leases made before 1881, and not only after that date, as under the former Act.

DILAPIDATIONS AND WASTE

In the course of a paper on this subject given on Thursday, November 3, before the Auctioneers' and Estate Agents' Institute of the United Kingdom, Mr. W. T. Creswell (Barrister-at-Law) said: Not infrequently the so-called schedule of dilapidation was nothing more than a specification of works which, it was claimed, should be carried out in order to put the property surveyed into a suitable condition of repair, the legal liabilities of the parties as defined by the nature of the covenant existing between them not being therein calculated or considered; or, where there was a covenant, the general principles of law were often disregarded with equal equanimity. Much of the law referred to was definitely given under statute. The last few years had seen the passing of several Acts of Parliament. He would name among these:—

The Housing and Town Planning Acts, 1909-23.
The Increase of Rent and Mortgage (Restrictions) Acts, 1920-23.
The Law of Property Acts, 1922-25.
The Ecclesiastical Dilapidations Measure, 1923.
The Agricultural Holdings Act, 1923.
The Housing Act, 1925.
The Public Health Act, 1925.
The Settled Land Act, 1925.

"Dilapidations" was a term which was only applicable to such injuries to property as involved legal liabilities which would arise from any breach of the contract to repair. In 1844 the R.I.B.A. defined the term as "those defects only which have arisen from neglect or misuse." "Waste" was the term applied to an act causing a defect to premises by the tenant in possession, some legal liability being created thereby in the nature of a tort or wrong quite apart from any contract to repair.

A landlord was not under any *general* liability to put demised premises into repair at the commencement of the tenancy, nor to carry out repairs during the tenancy, but only when he had contracted to do so or when he fell under an obligation to repair imposed by Statute. He could let a tumbledown house unless it came within a Statute, or was let furnished. He had no right at his own wish and without the consent of the tenant to enter and carry out repairs, unless he had reserved to himself the right to do so, or was empowered by a Statute to do so.

There was an implied warranty of *fitness for habitation* on the part of the landlord at the commencement of the term in the case of the letting of a furnished house, or furnished apartments, with or without attendance, and this applied to every part of the demised premises. This implied warranty was broken if the premises subsequently became unfit, owing to defects which existed in the premises at the time of the demise. In these circumstances the remedy of the tenant was to remove from the premises on discovery of the defect, and to bring his action against the landlord for breach of contract; but he could not take this course on a mere sentimental apprehension of risk or dislike to the premises; he must have some real cause of complaint to support his action.

The provisions of the Housing of the Working Classes Act, 1890, and the Housing, Town Planning, etc., Acts, 1909-23, were now contained in the Housing Act, 1925. Under Section 1 (1) of the Act of 1925, in letting any house, or part of a house, for habitation, of a rental not exceeding, in the administrative County of London £40, and elsewhere £26, there should be implied a condition that it was, at the commencement of the holding, in all respects reasonably fit for human habitation, and an undertaking that the landlord should, during the holding, keep the premises in all respects reasonably fit for human habitation. But the above condition and undertaking were excluded when the letting was for a term of three years or longer, upon the terms that the premises were, at the outset, put by the lessee into a condition reasonably fit for occupation, and that the lease was not determinable by either party before the expiration of three years. The section applied to a tenancy made either before or after the commencement of the operation of the Act; but in the case of a house situate elsewhere than in the administrative County of London, or in a borough or an urban district with a population (according to the last census for the time being) of 50,000 or upwards, the rent whereof exceeded £16, this section should not apply if the tenancy was entered into before July 31, 1925.

If premises were in want of repair at the time of the letting, or the landlord had covenanted to do repairs, and the want of repair arose during the letting, and the premises constituted a nuisance to the public, and a person, a member of the public, was injured in passing, then the landlord was liable for the injury, provided he had notice of the defect. There were only two ways in which a landlord could be made liable for injury caused to a passing stranger by the external defects of premises let to a tenant: (1) when he had contracted with the tenant to repair; (2) when he had let the premises in a ruinous and improper state and was aware of their condition and the tenant did not covenant to put them in repair.

If at any time during the term of the lease the landlord was held liable for injury, owing to his breach of an express contract to repair the interior of the premises, the liability (unless the defect amounted to a nuisance) did not extend to the tenant's family, guests, licensees, customers or workmen; for there could be no liability to any person to whom the landlord did not owe a duty. Only the tenant could sue on the contract between himself and the landlord.

A licensee of premises had not exclusive possession of the premises licensed to him. He was in the position of a guest. The grantor of the licence was only liable to the licensee for a latent danger that he knew of, and the licensee did not; but, if the condition of the premises in which the danger lurked were patent to the licensee, then the grantor would not be liable.

An owner or occupier was not liable to a trespasser for the safe condition of the premises the latter trespassed upon; and, in the house, the occupier could lay a man-trap or spring-gun for trespassers; but if he laid a trap, or placed a secret danger, with the intention and result of injuring any particular person he knew intended to trespass he was liable.

In law, flats, chambers, and portions of buildings let separately, and self-contained, and with separate entrances thereto opening on to a common staircase, were in all respects separate houses. The owner of each flat was entitled to vertical support from the lower part of the building; and included in the letting of each flat were the outer walls of the flat. Where a portion of a building was let separately, there was no obligation on the part of the landlord to keep any of the other portions of the building in repair, except such parts as remained under his own control, and which it was necessary should be repaired for the use and enjoyment of the premises demised.

Liability under a repairing covenant commenced as soon as the lease was executed. A lessee was not liable for any dilapidations that had occurred prior to the execution of the lease, even though these dilapidations should appear at a date subsequent to that of the commencement of the demise. Where a demise was from some future date, the liability to repair began to run at the commencement of the tenancy. A covenant, therefore, to "leave the premises in the same state as they are now in" meant in the state they were in at the date fixed in the lease for the tenant's entry.

The liability to repair remained during the whole of term, and a lessee could not shift a responsibility by assigning his interest in premises, for the covenant to repair "r with the land." If premises were taken un compulsory powers, the liability of the les remained until possession was given up. where a lessee entered into a covenant to bu or not to build, such covenant might be charged if an Act of the Legislature, pas subsequently to the lease, made its observa unnecessary. If, however, any portion of s land was not required by the statutory b under the Act, and it was subsequently as superfluous, the covenant to build or to build was revived in respect to any par land so sold, and the purchaser thereof came liable under the covenant. A cover to execute repairs in a particular year, du the term of the lease, imposed an obliga on the party concerned to perform it as as the year commenced.

A lessee, who held over after the exp tion of his term, entered upon an imp tenancy from year to year, and was in gen liable under the repairing covenants of expired lease to the end of his tenancy. liability might extend to rebuilding in cas fire. If the facts showed an express or imp obligation to hold over upon the terms of expired lease, then the law said that tenant held subject to all the covenant that lease which were *applicable* to the ye tenancy, and that he could be sued by landlord for a breach of those covenants plied by law. Otherwise the tenant held upon the terms which the law by implica introduced into such a tenancy.

Eviction of a tenant, for non-paymen rent, from part of the premises did not lieve him of his liability to repair during term of his lease, not even if he subsequ gave up the remainder of the premises.

An express covenant that the lessee repair did not empower the landlord to for alterations or improvements, and th it might mean, for instance, the renewal floor, it did not include laying such flo an improved plan.

Under a covenant to repair, a tenant took over premises which were in a sta disrepair bound himself to bring such mises into a suitable state or conditi repair, unless the terms of the lease an specific terms of the covenant to ke repair expressly and otherwise assigned liability, or defined the condition in whi premises were to be maintained. Lurcott *v.* Wakely (1911), 1 K.B. 905.]

Although there be no express covena a lease including the repair of buildings might be erected subsequently to the c of the premises, yet the covenant to not only referred to those premises orig included in the lease, but extended t repair of any additional buildings and fixtures. A covenant to repair "the de buildings" would, however, only i those buildings existing at the time demise.

In Lister *v.* Lane (1893), 2 Q.B. 21 covenant was to "sufficiently and su tially repair, uphold, sustain, ma amend and keep." The demise was for years, and the dwelling-house was ov years old. One of the walls bulged c fore the end of the term, and was cond by the District Surveyor as a dan structure, and was pulled down. It wa on a timber platform resting on mu this had rotted beyond repair. It coul been underpinned, but the Court said pinning was not repairing, but rebu and the tenant was not liable to *rebu* house. If repairs could not be done effecting improvements, then the fa not relieve the tenant from the ob to repair.

The general covenant to repair co in a lease was often followed by one c of the following expressions: "Fair w tear excepted," "fair use and wa cepted," "reasonable wear and excepted." In the light of the where these phrases had come to the for construction it would appear th

be taken to mean the same thing; heless, it was not sufficiently clear was the exact extent of that common cance. As previously stated, the l covenant to repair assumed an im- obligation on the part of the lessee to it dilapidation and waste, and to make ny defects which had not resulted from asonable use of the premises, or their ry and natural deterioration due to the its acting upon them, or to any faulty aying materials included in the build- t the time of the demise. It would ore appear that any one of the expres- might be taken as automatically implied covenant to repair, apart from any s clause such as referred to above.

eneral repairing covenant was applic- o everything which was the subject of mise, and included not only the build- existing at the commencement of the but also all those buildings which might ected during the term. Where, how- the covenant was expressly to keep in "the demised buildings," then could uch buildings be included in the cove- o repair together with such additional ng erected during the term which d an essential part of the buildings ally included in the demise. The cove- to repair would also appear to extend tures erected by the lessee during the i.e., "fixtures," using the term in its sense, not to "chattels" which were y connected with the freehold by a or temporary attachment. The cove- to yield up in repair all erections and ngs did not, however, extend to build- erected by the lessee during the term for the purpose of trade and manufac- in the instance where these merely upon blocks or pattens.

landlord was not responsible for the condition of the chimneys of the es demised; and though a tenant might stified in refusing to enter on the tenancy after he had signed the lease if he discovered serious defects not known or disclosed to him previously, having once taken possession, he was not entitled to terminate the tenancy without giving proper notice to his landlord.

Painting, papering, and whitewashing were "decorations"; and, under a covenant to repair, a lessee was only bound to do such painting, etc., as would prevent woodwork and the like from deterioration due to the lack of it. It was customary to insert a special "paint" clause in the lease; as, for instance, "to paint internally once in every seven years, and externally once in every three years." This was a continuing covenant, and, for obvious reasons, it was better to word the covenant "once in every third or once in every seventh year respectively," and, further, to stipulate that the last painting, both inside and out, was to be done just before the termination of the lease.

A duty to give notice was *implied* when the tenant was in occupation and had the means of knowing the condition of the structure, and the landlord had not, and had no right of entry.

INSTITUTE OF ARBITRATORS

THIS Institute held a luncheon on October 18 at the Criterion Restaurant, when the President (Mr. H. B. Chaplin Baldwin) spoke on the objects for which the Institute was founded and the manner in which the Council was endeavouring to further and achieve those objects. There were four main advantages of arbitration as a method of settling disputes. In the first place, a dispute might be settled in the district wherein the parties either resided or carried on their business. The second advantage was closely allied to the first, namely, that the dispute once formulated into a submission might be settled very speedily, and not be relegated to a waiting list. Thirdly, the atmosphere of an arbitration was in its very essence different from that of the High Courts; while, lastly, he would refer to the advantage of the reasonable cost of this method of settling disputes. It had been urged that arbitrations had been known to cost more than High Court actions. It would, however, he thought, be agreed, by all those who had had any practical experience of arbitration, that in almost every case the cost had been considerably less than that in which a High Court action involves the parties. It was counted that an award properly made was as binding as much as a decision of the High Courts and the subject-matter could not be referred to the Court subsequently. An effort was being made, at any rate with all the most important commercial countries, to establish a standing of arbitration award internationally. What he had said regarding arbitration so far pointed to the immense responsibility resting upon the shoulders of the man chosen to act as an arbitrator, and if and when an international acceptance of such an award became an established fact, that responsibility would be increased very considerably. Seeing the great powers that were confided to an arbitrator, it was not surprising that these were circumscribed most carefully lest they should be abused. If difficult points of law arose, either party might, unless the arbitrator acted on his own initiative, demand that they should be referred to a Court or Judge for determination, and for a direction to be given to the Arbitrator.

An award might be referred back for reconsideration if it failed to fulfil its requirements in the following respects:—

1. If it is defective in such a manner as to empower a Court, if it wishes to do so, to set it aside.
2. If it is not final.
3. If the submission has been exceeded.
4. That omissions have been made in inadvertence.
5. That it is defective in form.
6. That it contains a mistake admitted by the Arbitrator.
7. That new and material evidence has been discovered.

He would refer once more to the Report of the Special Committee of Chambers of Commerce in which it was stated that "the failure of Arbitration to take its proper place in commercial transactions is that the methods of appointing arbitrators have been haphazard and that it has depended upon the individual experience of the man appointed as to whether the procedure followed has been such as to ensure a fair hearing to both sides." This difficulty in dealing with Arbitrations was one which the Institute had always recognised.

It would therefore be readily recognised that it was very essential that the arbitrator should be fully and properly equipped to carry out his duties with complete satisfaction and with security to the parties concerned. The Institute of Arbitrators dealt with the theory and practice of arbitration; it aimed to educate and equip its members to be efficient and just arbitrators. While it recognised the value of special knowledge of the subject-matter in dispute, it realised that the man with special knowledge would have to be educated from being only an expert witness to becoming an arbitrator. In moving a vote of thanks to their President, Mr. E. H. Hawkins raised the question as to which callings representatives thereof were eligible for membership, stating that membership of the Institute should be open to all. Capt. W. T. Creswell, in supporting the vote of thanks, said membership was open to representatives of all callings in which arbitration was of use in the settlement of disputes.

The vote of thanks was carried unanimously, and the proceedings terminated.

IPARISON OF PRICES OF BUILDING MATERIALS ON OCTOBER 1st, 1927, WITH CURRENT PRICES.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

NEW BUILDINGS IN EDINBURGH

In a review of the work of Edinburgh Dean of Guild Court during the past year, Lord Dean of Guild Bruce, at the annual meeting of the Guildry of Edinburgh in the City Chambers, said that each year since the war had shown a continuous increase in the value and amount of the works of the Court. The past year, he was thankful to say, had been no exception, though one feared that they were coming pretty near the peak in the value of their annual building operations. Personally, he thought they had reached it. The value of the works approved of had amounted to over two and a half millions sterling—the exact sum being £2,524,376—as compared with £2,460,965, an increase of £63,911. Though the increase was only £63,911, yet the work of the Court during the year under review had been much heavier than usual, as the number of warrants granted amounted to 1,687, as compared with 1,461 in the previous year. The increase was due to the large number of minor warrants sanctioned. It would be, he said, possibly a matter of surprise that the total number of houses approved of amounted to only 2,080, of a value of £1,168,633, compared with 2,586 of a value of £1,545,755 in the previous year, but the reason for this was not far to seek. The end of the present subsidy period was now within sight, and the Corporation, as well as the private builder, were both affected thereby. Referring to the Edinburgh Corporation Order, 1926, which came into operation on May 15, and which contained an amenity clause which gave the city power to control the design of all buildings within its area, the Dean said that it might be found that the fact that such power to deal with amenity was now available would be sufficient to prevent unreasonable proposals coming before the Court; such had been their experience so far at any rate.

Paint Manufacturer's Estate.

Mr. Frederick Bentley, of Birkenhead paint manufacturer, director of Messrs. F. Goodlass, Wall & Co., Ltd., and of Ford & Co., Ltd., left £91,616 (net personalty £89,557).

THE SCOTTISH BUILDE

NEW BUILDINGS IN SCOTLAND

Coalsnaughton. — HOUSES. — Two-roomed houses are to be built by Clackmannan County Council at Coalsnaughton at a cost of £364 each.

Edinburgh.—BUNGALOWS.—The Edinburgh Dean of Guild Court has sanctioned an application by the Corporation for the demolition of vacant property at 66-73, St. Giles-street; 1-5, St. Giles-place; 41-45, St. Andrew-street; and 1-6, St. Andrew-wynd, Leith, in connection with the slum clearance scheme. The Corporation also received warrant for the erection of a child welfare clinic and three houses at the Prestonfield housing area, Dalkeith-road; and the following were also granted: Mr. C. H. Dunlop—four bungalows off Craigleith-road; Edinburgh and Suburban Building Society (Ltd.)—three double bungalows at Craiglockhart crescent; Messrs. Scott & Co.—two villas and two garages at Cadogan-road, Liberton; Messrs. Smith & Murdoch—three bungalows at Traquair Park West, Corstorphine; Mr. A. Ross—three garages at Henderson-buildings, Blackhall; Mr. J. Miller—six double bungalows at Orchard-drive.

Edinburgh.—ROAD.—The Burgh Engineer is to prepare a report of the proposed scheme for a new road in connection with the Fountainbridge Town Planning scheme. The proposed road is from the west side of Tollcross School to Gilmore Place-lane.

Falkirk.—BUILDING.—The Falkirk Dean of Guild Court has granted permission to Mr. A. D. P. M'Gregor, baker, Roberts Wynd, Falkirk, to erect a new building, consisting of shops, bakehouse, and house, at the corner of Bean-row and High Station-road, at an estimated cost of £3,000.

Glasgow.—HOUSING.—The Housing Committee have agreed to instruct the Medical Officer of Health to prepare a report on a proposal to give special housing facilities to families containing tuberculosis patients under treatment.

Glasgow. — BRIDGE. — The Corpo Statute Labour Department have appli the Health Committee for alternative a modation on behalf of 24 families liv houses at Tunnel-street and Finn street. These houses are now on th which has to be cleared for the prelim work connected with the construction proposed new bridge over the Cly Finnieston.

*These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployments Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

TRADE NEWS

Enlarged Joinery Works.

We are informed that additional new plant has been installed and substantial improvements made to the works of the Central Joinery Company (1927), Ltd., formerly The Central Aircraft Co., Ltd., 179, High-road Kilburn, N.W.6. The firm is now in a position to cope with a much larger volume of work, and is at present carrying out joinery for the new University extensions at Cardiff, King William street House, the New Empire Theatre, Leicester-square, the Regent Arcade, and many other important contracts, including several finely carved panelled rooms. The firm is in a position to tender for high-class joinery or cabinet work, church fittings, ship work, carving, ornamental plasterwork and good-class decoration.

Decorators' Travelling Exhibition.

The Travelling Exhibition, consisting of the prizewinning apprentices' and craftsmen's work, submitted for the 1927 Competitions, organised by the National Painters' and Decorators' Joint Education Committee, will be on view at the Northern Polytechnic Institute, Holloway-road, N.7, until November 9, and at the Brixton School of Building, Ferndale-road, S.W.4, from November 14 to 23 inclusive.

"Coty House," Stratford-place, W.

In connection with these premises, which we illustrate this week, we learn that the elevator was supplied by the makers, Messrs. Pickerings, Ltd., of the Globe Elevator Works, Stockton-on-Tees. This firm, by the way, have issued an attractive catalogue "Lifts that serve the Empire." In good display, this catalogue deals with the question of the technical problems of the lift, profusely illustrated with photographs of the various types of elevator which this firm supplies. Application for the catalogue should be made to the makers.

The Process of Varnish-making.

A number of well-known Portsmouth architects and builders had an interesting trip to London by saloon coach on Tuesday, October 25, a visit organised by Messrs. Thompsons (Portsmouth), Ltd., in conjunction with Messrs. Robt. Ingham Clark and Co., Ltd., and R. Gay and Co., Ltd., for the purpose of seeing the actual processes of paint and varnish manufacture at the combined works of the two associated houses mentioned, who are interested in the movement for bringing together those who specify, use, distribute and manufacture decorative materials. It is a policy which gives opportunity for the exchange of ideas and makes for a better understanding of the requirements and difficulties of each section of the industry.

Fire-resisting Paint.

A series of demonstrations of the fire-resisting properties of "Colardo" Universal Fireproof Paint and Impregnating Medium was witnessed on Thursday, October 20, in the grounds of the Alexandra Palace, London, N.22. Amongst those present were representatives of the Army and Aircraft Boards, the India Office, Imperial College of Science, and the London, Midland and Scottish Railway. A series of tests which went to display the fire-resisting qualities of the paint were carried out, particulars of which may be obtained from the Amalgamated Processes, Ltd., of 3, Grosvenor Gardens, S.W.1.

Portable Bench Band Saws.

Messrs. A. Ransome and Co., Ltd., Stanley Works, Newark-on-Trent, have issued a leaflet illustrating and fully describing their portable bench band saw, type 333, run from the ordinary electric light circuit by means of a D.C. or single-phase A.C. motor. An infinite variety of curved and straight work can be sawn, as it can be run at full speed for wood work, and at half-speed for cutting soft metals and the like.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A Copy will be sent by return, and your Remittance refunded if the Book does : : not satisfy your requirements : :

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXIII. No. 4423 NOVEMBER 11, 1927.

THE PRESIDENT'S ADDRESS

THE opening of the new session of a society of the standing of the Royal Institute of British Architects is generally the occasion for some reflections on the aims and objects of the Institute and the causes it represents, and the opening address of the President aited with some curiosity, as a revelation of the attitude e elected head of the profession towards the many questions ing a profession representing so many varied interests. cent years the annual addresses of the Presidents of the ute, though generally scholarly essays and of considerable mic interest, have appeared to neglect the consideration ojects of everyday professional concern and to that extent failed to satisfy those who have expected the President to to other subjects than the art the Institute exists to ote. Such expectations, which would have been some- unreasonable in the leisurely past, may be expected at a when a thirst for information comes before the quest of ledge.

Tapper's address, however, delivered before a large and ciative audience, should meet with general approval, for not only is reference made to a number of questions of ssional interest, such as new premises for the Institute, tration, the Architects' Benevolent Society, Bridges, England, the Height of Buildings, London's Squares, etc., e makes some admirable remarks on architecture itself— ks which we hope will be widely read as they mark the ss as a signally able one by a student of architecture who by rk has special claims to be heard. Though the theme be hat worn, its iteration is justified by its importance if, President says, architecture is a powerful factor for good community. No doubt he thinks the public get the ecture they deserve, for if "great architecture possesses all man virtues, dignity, modesty, restraint and so on," it is, tells us, "impossible to imagine that such can arise unless on is strongly possessed of these virtues," and "he would old man to maintain that dignity, for instance, is to-day mon virtue." We believe with the President this is, the main reason, as he says, at all events one reason why h architecture lacks that quality, though of course it may ued that if architects were all properly trained and ed men—trained to design dignified and well-proportioned gs—they would inevitably accomplish satisfactory work, this event it would not be quite logical to assert that only if aracteristics of virtue and dignity to which he refers are mmon possession of the people shall we obtain their ex- n in architecture. The public educated in the principles itecture is never likely to be more than a small proportion people, and while such an educated public might require pression of these characteristics in architecture, the mass people would not, and are we not more likely to get e want and what the public would accept if all those ll themselves architects were possessed of these char- ics themselves? No doubt, as the President says, it be of great advantage to the community if the Press the same keenness in architecture and the arts generally oes in the sayings and doings of politicians, but in the ration of this question much more depends on the ctural profession itself than upon the Press, for we hope for such an improvement in public appreciation of architectural art if architects are not always in advance of the public—or at least able to give what that very limited class, the educated public, may call for. The Royal Institute of British Architects is, we know, well aware of the primary importance of the education of architects, and in all important centres of activity there are those who are doing excellent work in teaching our young architects to design in beauty and build in truth. This is all to the good, for while we may hope to see improvement in public taste, the directing influence, the guidance, must come from architects themselves. We have no doubt the President will agree with us, especially as he reminds us that in the great days of architecture there was a deep-rooted sense of style, the principles of which were accepted by all, with the traditions connected therewith. These escaped, he says, at the end of the eighteenth century and have not been wholly recaptured, and architects must make up their minds that if architecture is to play the important part it should in the life of the nation, those traditions must be recovered, so that architects will all work with the same aims and to the same end. This is no doubt historically accurate, but the efforts to recover these lost traditions must, of course, be the work of architects themselves, and the possession of dignity, modesty and restraint by the public will not be sufficient without the specialised knowledge and training of architects. Nor must we forget the vital expression of our modern needs, or, as Sir Reginald Blomfield recently expressed it, "the mastery of architecture as a vernacular art." Modern architecture must have its own characteristics, whether carried on through tradition or evolved by a combination of the æsthetics of engineering and the functional demands of buildings.

We cannot refer to all the many suggestive observations to be found in his very thoughtful address, but we must record our satisfaction that the President did not forget to mention the subject of the preservation of rural England which, in our opinion, is of vital importance to our national well-being. Though a society has been formed to prevent the desecration of the countryside, the work of spoliation still goes on, and though public opinion is no doubt being educated, though slowly, the unfettered activities of many owners of property still goes on. It is high time we bestirred ourselves to preserve our beautiful country from the thoughtless ignorance of those among us who do not realise their responsibilities. As the President said: "If any one of us were to draw a brush of whitewash across a picture of Titian's or any great master's work, we should, rightly, be considered mad and probably locked up, and yet vandalism as serious, or more so, is occurring daily over the whole countryside without let or hindrance."

We cannot conclude without expressing our admiration for the obvious sincerity and clarity of the President's remarks. He himself is a true artist and in that sense is highly qualified for the distinguished position he holds, and we feel sure that the impression which the Dean of Westminster said the address had produced upon him, will be felt by others. We can only hope that if artistic intuition and insight are to be considered, the keynote of an architect's qualifications, that the influence of an artist at the head of a body such as the Royal Institute of British Architects will always be a predominant factor in its standing and importance.

NOTES

Westminster Abbey.

We do not think much anxiety need be felt as to the future of Westminster Abbey. It is such a valued possession to us all that anything which would injure its beauty and charm is unthinkable. Some thirty to forty years ago the question of some further room for the placing of memorials to distinguished people was very definitely raised and schemes were propounded by Mr. Shaw Lefevre and others—amongst them the suggestion of the late J. L. Pearson, R.A., received much attention, and one at least of these was published in *The Builder*. We reproduce to-day the various suggestions put forward at that time by Mr. Pearson. It has been pointed out that the Cathedrals Commission has not ventured to pass an opinion on the suggestions made by its sub-commission, and merely concur in the urgency of the problem of providing accommodation for memorials "whether by additional buildings or otherwise."

A Suggestion.

We have spoken to a good many whose opinions are worth having, and we must say the general feeling appears to be that any addition to Westminster Abbey which would interfere with its time-honoured appearance would meet with very strenuous and widespread opposition. To erect a separate detached building as a national Valhalla would not provide a memorial place of anything like the value of the Abbey building itself. Under all the circumstances is it possible to consider the suggestion of a crypt under the Abbey itself, just as we have one at St. Paul's? This might be made a beautiful shrine for our great dead, and would be far less costly than a separate building. It could be approached by a stair from within the nave and could be made a really impressive vaulted hall (of no great height) with its altar and fair space for an audience at ceremonial burials. In any scheme for the future memorialisation of those who are worthy of the honour, there should be a definite limit of size and the long sprawling monuments of the 17th and 18th centuries should not be allowed.

The Abbey Precincts.

There is such a feeling of rest and quiet in the wide green sward of the Abbey's north front, protected by characteristic stone and iron railings, that it would be a pity were its quiet disturbed by additional building. It adds that sense of detachment which is so suitable to a religious building when removed a little from the hurry and noise of the street. To build over this restful haven, however good the building, is only to hide one good thing with another, and a new building can make no claim to the long associations which hallow its present state, while it hide the existing view of the A blotted out in order to create more for memorials to famous persons.

Use of the Triforium.

We give below a par letter published by Times," signed Fre Radcliffe (a membe the Cathedrals Commi which is worthy of remark. "Mr. Law Tanner has recently referred to vast upper Abbey in the Triforiu which few people know the existenc whose intended use remains a my Its easterly portion alone is as large the chapels which surround the Sanc with the addition of the Ambul It has some very beautiful sculptu windows, and it commands a qu markable view of the length Abbey. That it is above the level Abbey floor should be no more obj than that the Crypt of St. Paul's is the floor of that church. A broa could, I am assured, be intro without disfiguring the Abbey, an a roomy lift (such as we are provid Liverpool Cathedral) should not possible. With easy access assure Triforium would be visited as fre are the Crypt and Gallery at St. But, after all, the noblest memo the Abbey is the simple incisio name and date on the floor, abo ashes. For this there is ample ro generations to come."

Westminster Abbey: Monumental Chapel on Old Palace Yard Site.
Design by the late John L. Pearson. (*See pages* 724, 725, and 743.)

l of Carved Cartouche, Larkhall Estate Flats, Clapham.

he oval of rials.

As to the removal of existing memorials in order to provide additional space we feel sure the prevailing feeling would be against it, for tic and unworthy as many of are they still are a sort of historic that might be preserved. The f the report has let loose a variety ion on what is called "the extreme y of the problem," whether the is to retain the place it has held for es as the shrine of the nation's ies, etc. There is a doubt left in minds as to whether the statement a little misleading, as suggesting nly those who have given "noble " have been commemorated in ncient shrine. It must be re- red that much of the choking up Abbey with memorial statuary has ed during the last hundred and ars. It has very little sanction in ty, and much of the statuary is ted with political personalities of varying degrees of importance, to its propinquity to the of Parliament, the size of the bearing little relation to the ance of the persons represented. on the whole we think these ials should not be removed, we t appreciate a conservatism so us for the bad that we should by extensions which might be ble, a building which has much ertain claims upon us.

tects the ey.

Our remarks on the Abbey extension scheme are based on the question of disturbing the ancient fabric, and not in any way from any that architecture could give a count of itself if called upon for posed additions. On the con- ve deprecate most entirely the distrust of our own time and powers which suggests to some that we cannot give good things. It may be the Dean of Westminster has not chosen a happy way of introducing the question of how the work should be done, but we have no doubt that it can be done well if there is wisdom shown in the way of setting about it.

The Dean's Control.

Two points in the remarks of the Dean of Westminster at the Institute on Monday night should give confidence to the public, for the Dean affirmed his fixed determination to see that the Abbey was primarily upheld as a place for the service and worship of God, and also that nothing would ever be done to the Abbey without the advice of the most able architectural opinion which could be obtained.

The London Architecture Medal.

A pleasant feature of the R.I.B.A. meeting on Monday evening was the presentation of the R.I.B.A. London Architecture Medal and Diploma for 1926 to Mr. Hubert Lidbetter for his Society of Friends building in Euston Road, a work familiar to our readers by the illustrations which have appeared in our pages. The President admirably summed up the qualities of the building in a few words, which must have afforded much satisfaction to the architect, and it was a pleasure to hear from Mr. A. N. Grace, representing the firm of builders responsible for the work, that so much goodwill and enthusiasm had gone to its creation.

Abbey Yard, Bath.
From an Etching by Mr. Harold Falkner.

GENERAL NEWS

Professional Announcements.

Mr. Gordon Griffiths and Mr. E. Brian Tyler, A.R.I.B.A., have entered into partnership and commenced practice at Midland Bank Chambers, East-street, Chichester, and would be glad to receive all trade catalogues.

Mr. E. G. Catchpole, A.R.I.B.A., formerly chief architect for housing and town-planning to the borough engineer of Blackburn, has been appointed to the new office of deputy borough architect of Plymouth.

Obituary.

We regret to record the death at Roslin Castle, Midlothian, of Mr. George Gregory, J.P., F.S.A.(Scot.), Fellow of the Incorporation of Scottish Architects. Mr. Gregory, who was 61 years of age, had not been in good health for the last two or three years. He was a native of Stonehaven, being the son of the late Mr. George Gregory, architect, of Stonehaven. Starting his business career with his father, whom he followed in the business, he built up an extensive practice in architectural and civil engineering works throughout Kincardineshire.

Architect's Estate.

Mr. Henry Kirkley, of 23, Fairfield-road, Ainsdale, Southport, formerly of Chorlton-cum-Hardy, architect, left £11,330.

Waterloo Bridge: No Change Reported.

At a recent meeting of the London County Council, Sir Percy Simmons, chairman of the Improvements Committee, said that no serious change had been observed in any of the arches of Waterloo Bridge since the summer recess. He had no information when the special committee of engineers would report on the question of Charing Cross and Waterloo Bridges.

Cornhill under Repair.

Replying to a question by Sir H. Dixon Kimber at a recent meeting of the City Corporation as to when the grave inconvenience caused by the work now proceeding in Cornhill would be removed, Mr. E. E. Finch, the City Engineer, said it would, he thought, be about two months before traffic would be allowed in Cornhill, and then it would only be possible to accommodate two lines for some considerable time. The sewer had to be reconstructed and other necessary work executed, and this would take considerable time.

SIR JOHN SIMPSON AND THE R.I B.A.

We have much pleasure in publishing the following correspondence in reference to Sir John Simpson's resignation from the Royal Institute of British Architects, to which reference was made in our columns in our issue of September 9:—

The British School at Rome.

My Dear Simpson,—The Council of the Royal Institute have just held their first meeting since the recess and have had an opportunity of considering your letter of August 13, and they have, by a unanimous vote, passed the following resolution, which they have directed me to transmit to you:—

> The Council of the Royal Institute express their profound regret at the unfortunate situation which has arisen with Sir John Simpson in connection with the representation of the R.I.B.A. on the Council of the British School at Rome.
>
> The Council wish to assure Sir John that there never has been in the minds of their members the slightest intention of acting with discourtesy towards him, especially in view of his position as a Past-President, of the great services which he has rendered to the profession and to the Royal Institute, and of the interest he has always taken in the work of architectural education.
>
> The Council, of which Sir John was for so long a distinguished member, wholeheartedly regret that their action has led to such feeling as he has thought it necessary to express, and appeal to him with confidence to reconsider his decision and to permit them to retain his name among their list of members, where it has stood for the past forty-five years.

May I hope to have the pleasure of hearing from you that you feel yourself able to respond to their appeal?

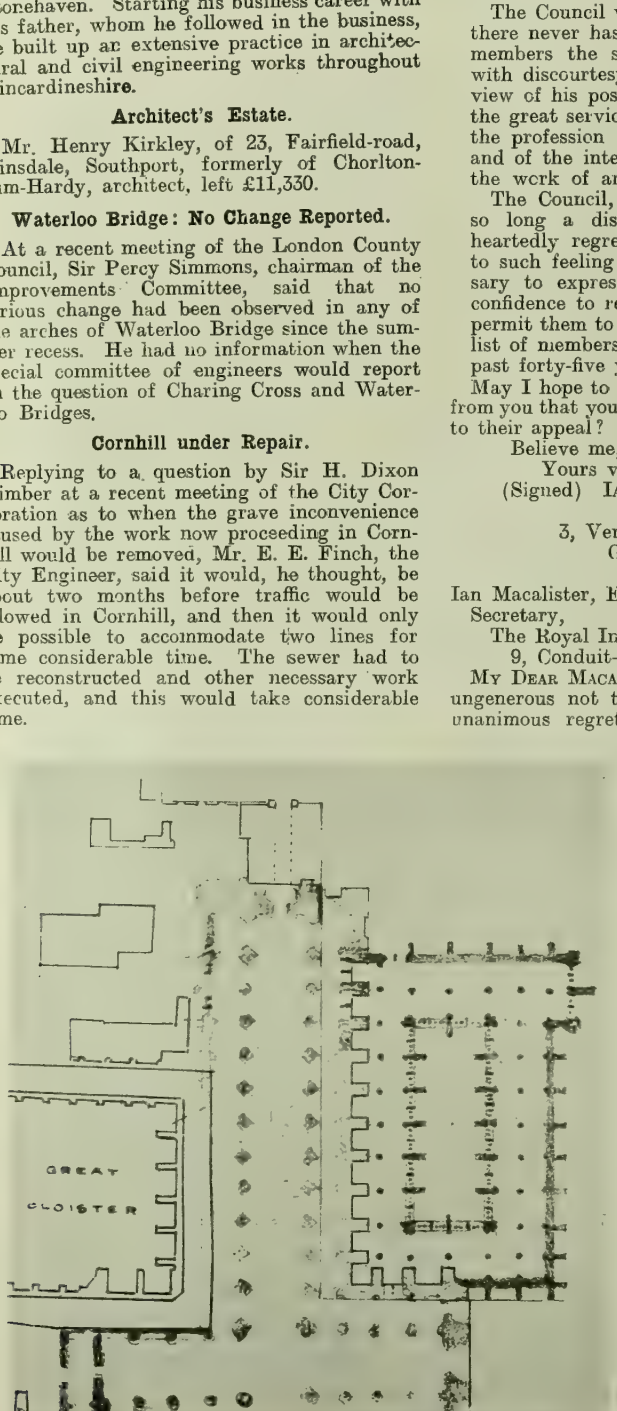
Believe me,
Yours very truly,
(Signed) Ian Macalister, Secretary.

3, Verulam-buildings,
Gray's Inn, W.C.,
3rd November, 1927

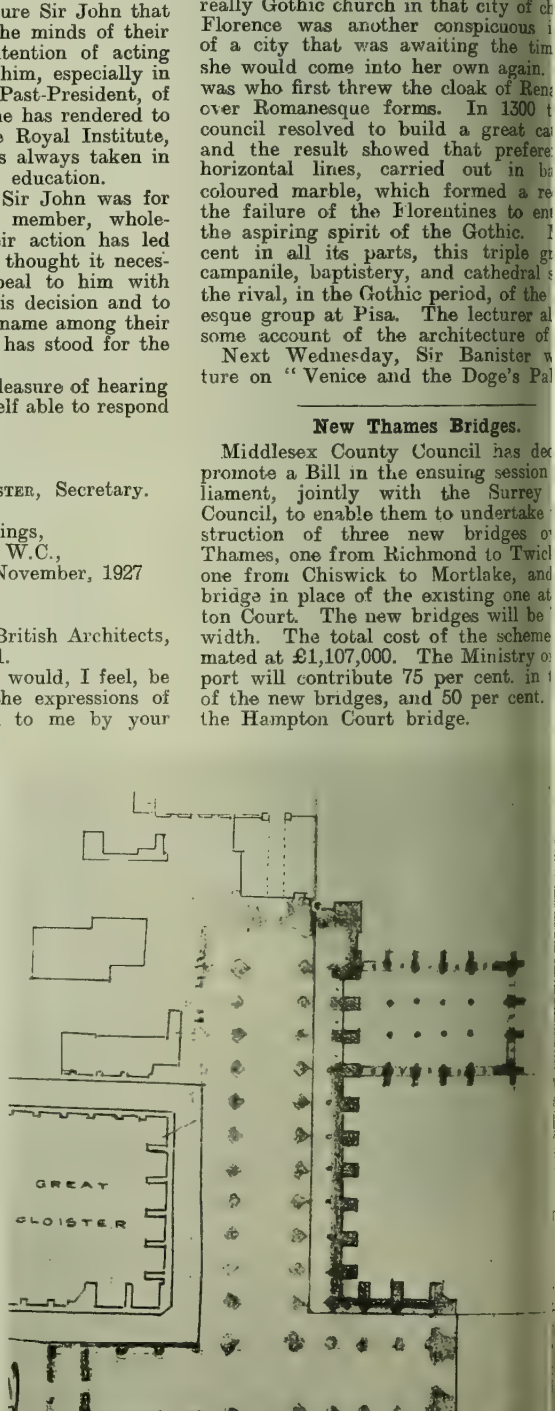
Ian Macalister, Esq.,
Secretary,
The Royal Institute of British Architects,
9, Conduit-street, W.1.

My Dear Macalister,—It would, I feel, be ungenerous not to accept the expressions of unanimous regret conveyed to me by your letter of the 28th ult. I therefore wi my resignation in response to the ap the Council.

Yours truly,
(Signed) John W. Sim



COLOUR IN ITALIAN ARCHITEC



Lecturing at the Central School and Crafts on Wednesday last, Sir H Fletcher, F.S.A., F.R.I.B.A., continu study of Gothic architecture in Ital pointed out that throughout the inde cities of Central Italy in the thirteen tury the unfamiliar Gothic style fr north was accepted and utilised in hearted sort of way. The restlessness northern art did not appeal to Italia loved repose in line and design. Th of Italy also was destined to beco headquarters of Renaissance architectu during the whole mediæval period it catch the true spirit of northern Rome herself had little use for the style. S. Maria sopra Minerva was really Gothic church in that city of ch Florence was another conspicuous of a city that was awaiting the tim she would come into her own again. was who first threw the cloak of Ren over Romanesque forms. In 1300 t council resolved to build a great ca and the result showed that prefere horizontal lines, carried out in ba coloured marble, which formed a re the failure of the Florentines to en the aspiring spirit of the Gothic. cent in all its parts, this triple g campanile, baptistery, and cathedral the rival, in the Gothic period, of the esque group at Pisa. tition for Concrete House Designs.

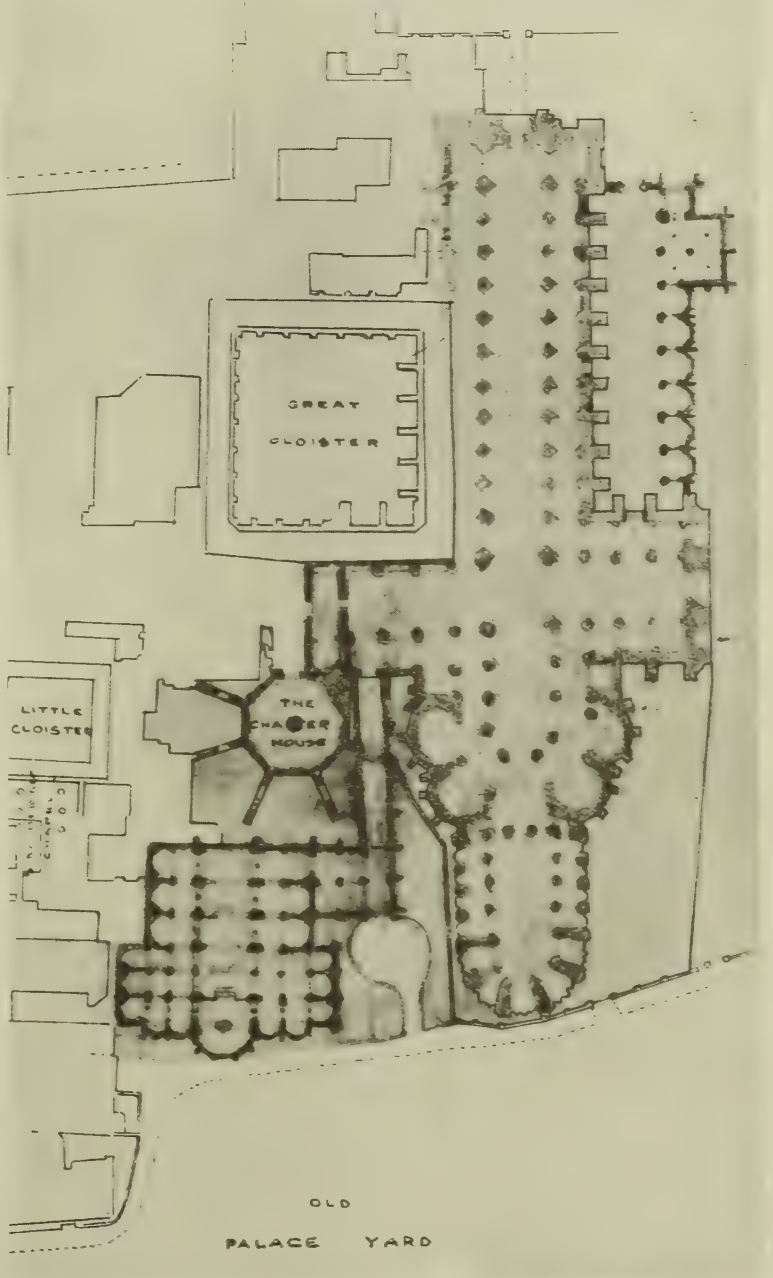
ing the competition which the Cement Selling and Distributing , have organised in conjunction with *Mail* (particulars being given in *ilder* for October 21), we learn that wing notes, amongst others, have wn up and are to be regarded as ntary conditions in the competition: purposes of the competition the sites for which the houses are are to be taken as level, and of the dimensions:—"A," 200 ft. by rontage; "B," 150 ft. by 60 ft. Both frontages to face south-east. rounding areas to each cottage may d as gardens, etc., the building line less than 20 ft. from the frontage. The plans provided with the conditions give the actual areas available for the erection of the two houses at Olympia, and the external dimensions of the houses must not exceed in the case of:—"A," 35 ft. 6 in. by 40 ft. frontage; "B," 45 ft. by 34 ft. frontage. No space for surrounding pathways need be provided, but at the discretion of the competitors a portion of the area at Olympia may be shown as garden. If it is considered expedient by the competitors, the garage may be embodied in the plan of the house "A" for erection within the limits of the site at Olympia. The stipulated cost of £1,750 for house "A" must cover the cost of the garage, whether it is designed as a separate building or embodied within the plan of the house at Olympia. A dual drainage system for soil and surface water is to be provided. The sums of £1,750 and £750 are to meet the cost of each house only, and the value of the site is not to be considered. The fullest advantages of the concrete adopted may be used without regard to local by-laws or the London Building Act. The floors throughout are to be of concrete construction.

Herne Bay Municipal Offices.

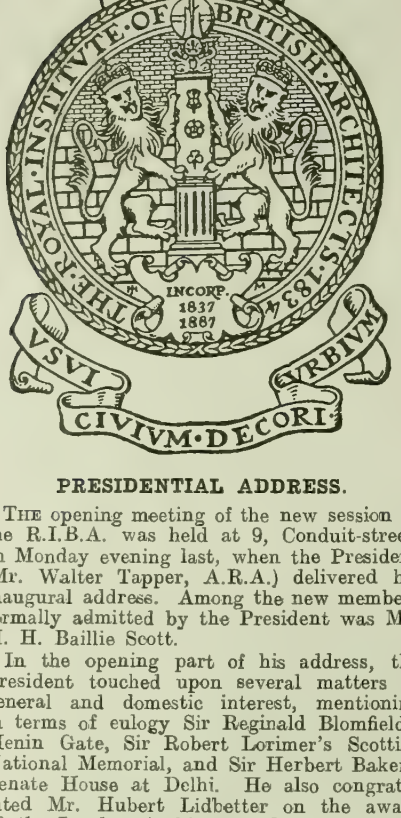
Professor A. E. Richardson, F.R.I.B.A., the assessor in this competition, for which 64 designs were submitted, has made his award as follows:—

1st (£150): Mr. C. Harrold Norton, F.R.I.B.A., 14, Bedford-row, W.C.1.



2nd (£100): Messrs. W. L. Clunie & William Tarn, 32, Mona-road, Walkley, Sheffield.

3rd (£50): Messrs. Symington & Prince, of 8, Market-street, Leicester.



Seaton Urban District Council Lay-out Competition.

The following notice has been issued by the R.I.B.A.:—

"The Competitions Committee desire to call the attention of members to the fact that the conditions of the above competition are not in accordance with the Regulations of the R.I.B.A. The Competitions Committee are in negotiation with the promoters in the hope of securing an amendment. In the meantime members are advised to take no part in the competition."

Proposed Additions to Westminster Abbey: Schemes Nos. 2 and 3.
By the late JOHN L. PEARSON. (*See page* 743.)

PRESIDENTIAL ADDRESS.

THE opening meeting of the new session of the R.I.B.A. was held at 9, Conduit-street, on Monday evening last, when the President (Mr. Walter Tapper, A.R.A.) delivered his inaugural address. Among the new members formally admitted by the President was Mr. M. H. Baillie Scott.

In the opening part of his address, the President touched upon several matters of general and domestic interest, mentioning in terms of eulogy Sir Reginald Blomfield's Menin Gate, Sir Robert Lorimer's Scottish National Memorial, and Sir Herbert Baker's Senate House at Delhi. He also congratulated Mr. Hubert Lidbetter on the award of the London Architecture Medal for 1926 to his new building for the Society of Friends in Endsleigh-gardens. Finally, he congratulated Sir Aston Webb on the honour bestowed upon him by the Royal Society.

A matter of considerable importance to the Institute, he continued, was the question of its future home. The family had outgrown its old one, and though it was sad to have to leave it, especially when it possessed some architectural refinement, as did the exterior of that building, yet he was afraid it was inevitable. They possessed the finest architectural library in the world, precious beyond words, and it could not now be accommodated there, without drastic alterations. The building was not even fireproof, so they would realise what the danger was to that fine collection, and the need for removal. The Premises Committee was giving careful consideration to the matter, and he hoped before very long it would arrive at a satisfactory solution. All he would like to say now was, that it was imperative that they should have a home worthy in all respects of the Institute. It should embody all that was best in architecture and carry on its fine traditions. When one saw such a place as, say, the Cambio at Perugia with its beautifully proportioned rooms and charming fitments, not forgetting the beautiful paintings of Perugino, surely it was not too much to hope to have a home of like dignity and charm.

Having referred to the present position with regard to Registration, remarking that the Bill was to be proceeded with, the President entered a strong plea for the more generous support of the Architects' Benevolent Society. He was told that the staff of one architect's office had pledged themselves to contribute 5s. each annually to the Society. Such an excellent example might well be followed by others.

In a reference to the question of bridges, the President commented upon the curious perverseness, common to human nature, with which strenuous efforts had been made to destroy Waterloo Bridge and to preserve that of Charing Cross, as ugly as Waterloo was beautiful. He would like, he said, to call attention to the efforts being made to preserve the many lovely bridges up and down the country; the value of them could not be over-estimated, and all such efforts should have their whole-hearted sympathy.

One of the most important matters, in his opinion, was that to which his immediate predecessor had given much attention, namely, the preservation of rural England. A society had been formed, with that laudable object in view. For many years the Urban and District Councils had controlled the practical arrangements of building and the by-laws of towns had been applied to the country, he feared, very often stupidly. Surely they might have some control as regards design; not a despotic one, such as would engender uniform monotony, but some controlling body, such as the Fine Arts Commission, might have jurisdiction in that matter. The difficulty always was to find the right men, using that controlling power with infinite wisdom.

Referring to the height of buildings, the President said there had been, as they knew, a demand for higher buildings in London, and it was to the credit of the members of the Institute that they, against their own interests, would have none of it. They felt, very strongly, that buildings of greater height than were now permitted would endanger the health of the community. We in this northern climate needed as much sun as we could get. It was little enough in any case. The traffic problem was bad in all conscience, and the height of buildings would obviously increase the difficulty. As a matter of tradition, it was a fact that in southern countries tall buildings with narrow streets were a necessity, as a protection from the sun. In northern countries low buildings with wide streets were generally found, in order that no unnecessary shade should be created. He hoped, therefore, that we should hear no more of the wish for higher buildings.

Turning to the question of London's squares, the President said we must use all our endeavours to preserve them. Open spaces were invaluable. We had lost Mornington-crescent and Endsleigh-gardens already, and, unless we took good heed, we should lose others. In this important matter we had to acknowledge gratefully the energetic action which had been taken by the London County Council. With their assistance, and that of the Royal Commission which was to report on this subject, we had reason for hope. His Royal Highness the Duke of York's appeal for playing fields was meeting with the success it deserved. It should have the cordial support of all, for it was imperative that our children should grow up in healthy conditions, to become fine citizens of the Empire.

It was a matter for congratulation, the President continued, that the public was showing an increasing interest in architecture. This interest progressed slowly but steadily, but we all knew that if modern architecture was to compare favourably with that of the past ages there was much leeway to make up. The Press lent powerful aid, more especially since the formation of the Architecture Club, composed as it was, of journalists and architects. Might he suggest to the President of this club, who had done much already in putting their aims before the public, that the Press could do still more. Nowadays, unless a matter was brought before the public day by day, it was soon forgotten. The Press could in this way give much help to the preservation of rural England. It was much to be desired that it should show the same keenness in architecture and the arts generally as it did in the saying and doing of politicians, and he thought that would be of great advantage to the community. Something might also be done in the way of propaganda; he meant by the distribution of leaflets and pamphlets to Rural Councils, local builders, etc., setting forth the aims of the Society, founded for the purpose of preserving this country of ours.

Architecture was a powerful factor for good to the community. We could not escape from it if we would. In our home our travels, it was always with us, so hoved them to see that it was good. architecture possessed all the human vi dignity, modesty, restraint, and so on was impossible to imagine that such arise unless a nation was strongly poss of those virtues. They had, on many sions, been asked in that room by em laymen, to do something for the educ of the public; but first of all the public have those virtues of which he spok they were to be expressed in architec Take that of dignity. He would be a man to maintain that this to-day was a mon virtue, and to his mind it was the reason why so much architecture lacked quality. If these characteristics were common possession of the people, they v require their expression in architecture, they assuredly would have it. He must fess himself in complete agreement with writer who said he failed "to understa certain modern school of thought v steadfastly ignores the past and, with a like simplicity, believes it can inst create something in art, literature, or tics, which shall be completely new. an impossible theory, for the plain fa we cannot escape from the past, and pro consists but in a slow and gradual dev ment." Also in the greatest days of tecture there was a deep-rooted sense of It was difficult to say exactly how this it was a slow and almost unconscious m ing of architectural forms from age to The principles underlying those forms accepted by all, with the traditions conn therewith. Those escaped us at the of the eighteenth century, and had not been wholly recaptured. difficulties which beset art to-day believed arose largely because of Architects must make up their m that if architecture was to play the portant part it should in the life of a n these traditions must be recovered, so we were all working with the same aim to the same end. We could then give people proper guidance on certain de lines. The masters in our schools s have a profound knowledge of those tions and the methods of the old ma The orders should be carefully studied was this scholarly knowledge which en the old men to build those great chu civic buildings, manor houses and cot which we saw and admired to-day. student in our schools need not both much about design; let him get the gr ing of which he spoke, and when his came, with the practical necessities o moment, he could not help but do good The atelier system should be encour Even in our own time we had this. were the Shaw men, the Bodley men a on, young men proud of their master proud to carry on his tradition. It wa to see, under such a system, with the sc ship of which he spoke, how soon the for tradition and style would spread instead of men speaking with divers to we should have one well understood lan We should be moving on two or three lines of development, which was essent

Apart from this loss of training and tional feeling from which we wer doubtedly suffering, there were many reasons for the lack of really great tecture to-day. The incentive for own for instance, could not be over-valued, a tainly it should be encouraged. Wh forefathers owned the land they built not only for themselves, but for children and their children's children so we obtained those lovely old houses were still to be seen. Incidentally th ing of ownership should lead to conte of mind and leave less room for social The times in which we lived were s plex that it was difficult to get at th of the difficulties and to overcome For instance, the herding together people in large towns, and, when there herding together in blocks of flats, all to take away from them the real s home life and its responsibilities. It mean living in the best sense, nor c

e the effect of a real home, and it helped reate the hustle and excitement of the ent age, which must militate against d architecture, since it inevitably elimi- d time for thought and quiet. The oduction of machinery had been, no ot, another reason. Mass production d never produce the best, for it was a ter of common knowledge that anything d in itself lost a great deal of its value n produced in bulk. The pleasing leties of handicrafts went by the board, no matter how good the design, it lost h of its charm in execution by machinery. en speaking of machinery in relation to ding, he would say it should only be for purpose of lessening weary and unin- sting labour, such as the punching of a through steel, and thousands of other things. It should not take the place of done by hand which interested and happiness to life. The predominance of anical labour, it seemed to him, must to mechanicalise men's minds; to make dull, and so less receptive of the fine leties of any art, be it architecture, ting, music, literature or any other. could people be expected to take an ligent interest in matters conducive to welfare so long as they perforce had to in mean and squalid houses or in un- resting flats. It was difficult to see how e matters could be remedied, but they at the root of the mischief, and until were remedied it was futile to expect y great architecture.

e greatness of a nation was not to be sed solely in terms of money, though, ourse, that was not to be ignored, but er on what that nation produced. When again erected buildings comparable to Abbey of Westminster or St. Paul's edral, painted pictures equal to the t Titian, new sculpture equal to the t Greek work, to say nothing of the r crafts, then it might be said that our on was great. It was a matter for grave ern that up to the end of the eighteenth ury hardly an ugly thing could be found his country, even down to the ordinary sils used for domestic purposes, and in this enlightened age we were sur- ded with ugly and offensive things.

e character of a people was expressed in better way than by the things it pro- d, in architecture perhaps best of all. greatness of the Roman Empire was not ssed solely by its military achievements, also by its architectural triumphs. It d be difficult to imagine that the men designed and erected the noble buildings ll admired were petty or mean. Human was full of contradictions, and he was d man to dogmatise on any subject rning it, yet he (the speaker) was iently courageous to uphold this con- on. Noble buildings meant noble men; ocre buildings meant mediocre people. with great ideals were often subjects rnirth. We were told they were so actical, and perhaps they were, we were told it was the practi- utilitarian who was wanted. Of e he was needed, but history told unmistakable terms that it was the st that we needed first of all. We were nformed in these days that great archi- re could not be afforded; it certainly ed to be so, but he ventured to think because money was being spent un- y. So far as one observed, it was being on things which were fleeting. Men l spend lavishly on motor cars what would think impossible to spend on homes. That made us realise that the s of men to-day were not thinking in of permanency. The system of building was one which it was impossible to ne could lead to great architecture. system, he believed, came from ica. As an organisation, it was splen- On big contracts it was arranged at ery beginning that every trade began finished at a specified date and speci- lour. The bricklayer, say, finished at and the plasterer began his work at 11.35, and so on. He presumed no time allowance was made for improvement as the work progressed. No mistake was made. Hardly human one would say. However, it seemed to be a sound method, if the governing factor was to be time and not architecture. How fearfully uninteresting this system must be to the workman. He, it would appear, was just part of a machine. He (the speaker) did not wonder the workman wanted to be half-way down the street when the closing bell rang. Architects were dependent on the workmen, if they were to have fine architecture. Design and execution could not be divorced, and it was only by arousing in the workman a love of his work, and by giving him a personal interest in it, apart from money, that they would get things worth having.

They could congratulate themselves that architecture was not liable to the vagaries of the Cubist and the Futurist, at any rate in this country. The idea that by turning it upside down you could get originality was not worth considering, and there were fortunately very few architects who had the desire. The ever widening problem of planning, new methods of construction, gave plenty of opportunities for expressing our own times, and if, with them, we preserved the methods and traditions of our fathers, he had no fear as to the future. He was not suggesting the copying of the ancient work that had done duty in the past. All he maintained was that the deeper a man's knowledge, and the wider his range of study, the more assured would be his own work. The only effectual sources of development lay in the practical interests of his own day. We had our own problems to solve, and they could be the better solved if a man knew how the old men solved theirs. The principles of our art had never, nor could they ever, change. New architectural forms in their outlines, grouping and massing would naturally develop according to the practical needs of the day; there was no need to strive for originality; that came inevitably, as it always had. Architecture was progressing slowly but steadily; it was better understood to-day than it was, say, in the fifties, and this might be said generally of the arts. In music, it was true, we had a great deal of jazz rubbish, but also, there was always an audience for the great classic masters, and if we wanted this universally, we should get it in due time, and so it was with our own art. There was a great deal of jazz architecture but there was a greater quantity of good work than was the case some years ago. Let us, therefore, be full of enthusiasm and keep good heart. The national architecture of this country, left to us as a noble heritage, was not dead. Let us not seek arrogantly for something new, but let us carry on this goodly heritage and make its influence for good felt by the whole nation.

Discussion.

The Dean of Westminster, proposing a vote of thanks, said Mr. Tapper and he had worked together for a good many years, and he felt that Mr. Tapper combined in himself the three qualities that he had given as being appropriate to an architect—dignity, modesty and restraint. He (the speaker) was an optimist as to the state of our architecture when we could show work such as Liverpool Cathedral, the new Chapel at Charterhouse, the Menin Gate, the War Memorial at Edinburgh, and, he would add, some splendid work in the Minster at York done by Mr. Tapper himself. We had architects and craftsmen who could do work that would stand side by side with any work done in the past. Turning to the question of Westminster Abbey, the speaker said he was surprised to find that the Press apparently thought that the schemes for additions to the Abbey were something absolutely new, whereas the principal offender was Gladstone. After a very long discussion by a Royal Commission, a portly Blue-book dealing with all the proposals now brought forward as something entirely new was published in 1890, and the Commission which sat recently examined with the greatest possible care and in full detail the proposals, and embodied their opinions in the report given to the public. Yet there were those, and those in high places, who were ready at once, without having seen the full report, and without having seen any documents or heard any evidence, to settle the whole question in a letter to the Press. As long as he had the heavy trust of being in charge of the Abbey, it would be used in the first instance as the House of God and for the worship of God, and whatever was necessary to make it more fit and adequate for that purpose would be done. Nothing would be done to the Abbey so long as he was in charge, except with the best-trained taste and advice that could be commanded. He was perfectly ready to consent, so far as his consent was necessary, whenever we got to the point of settling any plans, that those plans should be printed and published for the information of the public, but he was not going to take the slightest notice of the public verdict on those plans. He did not consider that a general referendum of the man in the street was the way to decide great questions of this kind. Those plans would be made by our ablest architects, men with the finest trained taste, with real knowledge of what they were doing. This was a matter for the aristocracy of art, and not for any democratic action at all.

Lord Lee of Fareham, seconding the motion, referred to Waterloo Bridge, and said it was largely due to the efforts of the R.I.B.A. that the matter had been taken up and a Royal Commission appointed. He felt extremely apprehensive about the bridge's future, and hoped that the R.I.B.A. would not rest on their laurels, but remain ever watchful.

The President then presented the R.I.B.A. London Architecture Medal and Diploma for 1926 to Mr. Hubert Lidbetter, A.R.I.B.A., for his building, The Friends' House, in Euston-road, which was, he said, a building which had the fine dignity and quiet repose that were always associated with the Society of Friends. He congratulated Mr. Lidbetter on expressing those qualities in his building, and the Society upon having such a delightful building for their new headquarters.

Mr. Lidbetter, in reply, said the distinction which he had received was of more value to him because it was conferred upon him by his professional brethren.

Mr. Edward S. Reynolds, Chairman of the Committee of the Society of Friends, in the course of a few remarks, said they had been guilty of building on an open space, but he would like to make it clear that they had tried many other sites and only decided upon Endsleigh Gardens when they found there was no possibility of maintaining it as an open space.

Mr. A. N. Grace, representing the firm of Messrs. Grace and Marsh, Ltd., the builders of the Friends' House, said he had never known a job in which a better spirit of fellowship had been manifested. Recognition of the craftsmen would, he felt convinced, do an immense amount of good in dispelling the spirit of unrest.

OBITUARY

Dr. David George Hogarth.

We regret to record that Dr. David George Hogarth, Keeper of the Ashmolean Museum since 1909, and a distinguished explorer and archæologist, died at Oxford on November 5, aged 65. He became, in 1897, Director of the British School at Athens, and from that base he explored Asia Minor and Syria and conducted expeditions in Cyprus, Egypt, Syria, and Greece for the British Museum.

Mr. George Gregory.

Mr. George Gregory, F.S.A. (Scot.), F.I.S.A., who has died at Roslin, Midlothian, was until recently in practice in Stonehaven as an architect and civil engineer. He was architect for the new Dunnottar School, the Savings Bank, and the renovation of the Town House of Stonehaven, as well as for many villas, houses, business premises and factories.

New Business Premises, Hastings.

These new premises, for Messrs. Plummer, Roddis, Ltd., at Hastings, have been erected, at a total cost of £85,000, from designs by the late Mr. Hy. Ward, A.R.I.B.A., of Hastings (Messrs. Henry Ward and Son, architects). The building, which is of steel-framed construction throughout, consists of a basement, ground floor, and five floors over, the total height from basement to roof being 83 ft. 6 in. Owing to the unusual nature of the foundation, a steel cum-concrete partial raft scheme with girder and cantilever girder construction has been employed to transmit and effectively distribute the weight of the building over the site. The whole of the floors are concrete, reinforced by filler joists, clear of all obstruction excepting for three main stanchions spaced at 40 ft. centres, thus giving a maximum of space in the show-rooms. The total area is 3,800 sq. yds.

The front elevation relies upon the simplicity of its proportion for effect, relieved by richly carved spandrils over a central arch and a projecting balcony panelled on the soffit and ornamented on the face at the fourth-floor level. The bronze metal shop-fronts are contained in pilasters of emerald pearl granite with a border and base of grey Cornish granite.

The basement is devoted entirely to marking-off rooms, stock-rooms, strong room and boiler-house. The ground floor, though somewhat restricted in showroom space, due to the nature of the site, has a large area devoted to shop-fronts and arcade. The principal showrooms occur on the first, second and part of the third floors, the remainder of the third floor being taken up by a hair-dressing department and the general offices. The entire fourth floor is used as a restaurant, with a service room adjoining, excepting for a public rest room and library. The floor, of oak, has been laid for dancing. The fifth floor is closed to the public, the whole of the floor space being devoted to the staff rest rooms, kitchens, offices, etc.

It is to be regretted that the death of Mr. Henry Ward occurred a few weeks prior to the completion of the premises after an illness lasting nearly three months. It is his last work and the culmination of a long and successful architectural career.

The steelwork was designed by Mr. Douglas S. Young, M.I.Mech.E., M.I.Struct.E., of 6, Queen Anne's Gate, Westminster, S.W. The general contractors were Allen Fairhead and Sons, Ltd., of Enfield. The principal sub-contractors were: Moreland, Hayne and Co., Ltd., constructional steelwork; the Bath and Portland Stone Firms, Ltd., Portland stone front; Fenning and Co., Ltd., granite pilasters and fascia; Richard Crittall and Co., Ltd., panel heating system; the Crittall Manufacturing Co., Ltd., metal casements; Baxter, Elliot, artificial stone staircase: Lawford and Co., asphalting; Courtney, Pope and Co., Ltd., shop-fronts and interior fittings; Bainbridge and Son, ground-floor fittings; Carter and Co., mosaic paving; Lamson Pneumatic Tube Co., Ltd., cash tubes; Benham and Sons, Ltd., kitchen equipment; Frederick Hayden, Ltd., domestic hot-water system; G. Tester, electrical work; Holophane, Ltd., lighting; John Every, fire-escape staircase; Hollis Bros. and Co., Ltd., flooring; Waygood, Otis, Ltd., passenger lifts; the Express Lift Co., Ltd., goods and service lifts; Arthur Searle and Co., fibrous plaster work; Osborne, Garrett and Co., Ltd., hairdressing department.

Messrs. L. A. Francis and Sons, of London, were the quantity surveyors.

The Larkhall Estate, Clapham.

The drawings reproduced in this issue show the start of a development that will provide a new residential district for London, taking its name, "Larkhall," from one of the boundary roads of the site, namely, Larkhall-rise, where some 1,200 small, well-appointed flats will be built in blocks forming large quadrangles, very much of the character of some of the old inns of London.

The first portion of the site which is being developed will contain 308 flats; in addition there will be small lock-up garages available for the tenants. These flats are contained in sixteen blocks, there being three separate type designs of blocks. These blocks have been so planned as to allow sunshine to penetrate to every living-room, and the blocks have been designed on the general basis of flats on the ground floor, maisonettes on the first and second floors, and maisonettes on the third and fourth floors.

The architects for the scheme, Messrs. Louis de Soissons and G. G. Wornum, FF.R.I.B.A., of London, were appointed by Sir Theodore Chambers, K.B.E., Chairman of Welwyn Garden City, to whose initiative the scheme owes its inception. They have had the benefit of technical advice from the Architects' Department of the L.C.C., resulting in the use of extremely economical and up-to-date systems of construction. Mr. G. W. Jenkins, who has had long service with the L.C.C., is acting as clerk of works.

A central system of hot-water supply is being installed in each block, for which Mr. W. W. Nobbs, M.I.Mech.E., etc., is the consulting engineer, and the installation is being carried out by Messrs. G. N. Haden and Sons, Ltd., an automatic oil fuel plant being used in each block. The main staircases in each block are being tiled throughout with glazed cement tiles manufactured by the General Tile Co., Ltd.

The exterior walls are of mottled red brick pointed with Atlas white cement, with artificial stone dressings made by the Enfield Stone Co. The electrical installation is being installed by the County of London Electric Supply Co., Ltd.

The general contractors for the first sixteen blocks are Messrs. C. Miskin and Sons, Ltd., of St. Albans, Herts. The quantity surveyor is Mr. S. A. Paine, F.S.I., of 2, New-court, Carey-street, London.

The sanitary fittings and ironmongery are being supplied throughout by the Welwyn Stores, Ltd. Woco doors are being used throughout the flats themselves. The ornamental ironwork is being provided by the Cashmore Art Workers, and some sculptured panels have been modelled by Mr. Gilbert Ledward. Messrs. Stirling and Johnson, Ltd., are the contractors for the roof tiling, the tiles being red sand-faced tiles, and the asphalt work is being carried out by Thomas Faldo and Co., Ltd.

Herne Bay Municipal Buildings Competition.

We illustrate this week the winning design in this competition, by Mr. Harrold Norton, F.R.I.B.A., placed first by the assessor, Professor A. E. Richardson. The full awards are given under "Competition News." As the proposed outlay is somewhat limited and the accommodation required is very considerable, extreme simplicity of design, both in the planning and elevations, has been the main objective. Elevations, whic will be in Georgian style, have been designe with a view to breadth and dignity of effect The scheme is to be a comprehensive one. A the Council may decide to build in section particular attention has been paid to th adaptability of the design to erection in on or more sections, a distinct line being pr vided between the Assembly Hall and th rest of the buildings.

The general accommodation required wa an assembly hall with galleries accommo dating 600 persons, municipal offices, in cluding a council chamber, a bank, a fe shops and private offices, the whole build ing to cost £40,000.

The elevations will be faced with Cante bury bricks, and all quoins of corners an windows of rubbed bricks, the ground stor in approved stone, and the whole of th buildings will be steel framed with fireproo floors. Oak flooring throughout, excep vestibules, halls and corridors, which wi be of terrazzo. Stairs will be of reinforce concrete, roofs of approved slates, and flat of steel and concrete covered with asphal The Assembly Hall and Council Chambe will have oak panelling around walls shown; the arched ceiling to the assembl hall and the domed ceiling to the counc chamber to be in fibrous plaster. Th general heating will be upon low pressur hot-water gravity circulating system, wit mains carried through and radiators fixed the various rooms, passages, etc., each fitte with valve for control.

Beckenham Municipal Buildings Competition.

We illustrate this week the secon premiated design in this competition, b Messrs. E. Berry Webber and J. O. Cheadl AA.R.I.B.A. The winning design, b Messrs. Lanchester, Lucas and Lodge, F and A.R.I.B.A., was given in our last issu Mr. Septimus Warwick, F.R.I.B.A., was th assessor.

Mural Decorations, Portman Rooms, Bake street, W.

We illustrate this week the mural decor tions and embellishments recently carried o at the Portman Rooms Dance Club, Bake street. The paintings, the work of M Frederick Francis, occupy the four walls the small ballroom, and represent early eig teenth-century subjects. There are thirty-t wall panels, both of village and country li

CORRESPONDENCE

Competition for Technical College, Manchester.

SIR,—In view of the fate that has befall the other large competitions promoted by t Manchester Corporation, would it not fairer to the architectural profession if so pronouncement were made as to the like hood of this scheme being built? It w generally be conceded that the endeavour a competing architect is to erect the buil ing, not merely to secure a money prize a set of drawings. J. O. CHEADLE.

The Death-Watch Beetle.

SIR,—While engaged on repairing t damage done by the death-watch beetle the roof timbers at the Sheffield Cathedra found that in comparatively recent days p of the old oak roof timbers had been placed by pitch pine, and that although th timbers had been attacked by the beetle, no instance had they penetrated more th their own length, in fact, dead beetles w found with their tails protruding from ho which their heads had drilled in the timb hardly more than one-half the length of th bodies. From this it appears that pitch p is poisonous to and proof against the att of the beetle, and suggests that pitch p would be preferable to oak for such purpos I shall be glad to hear of any similar perience. CHAS. B. FLOCKTON

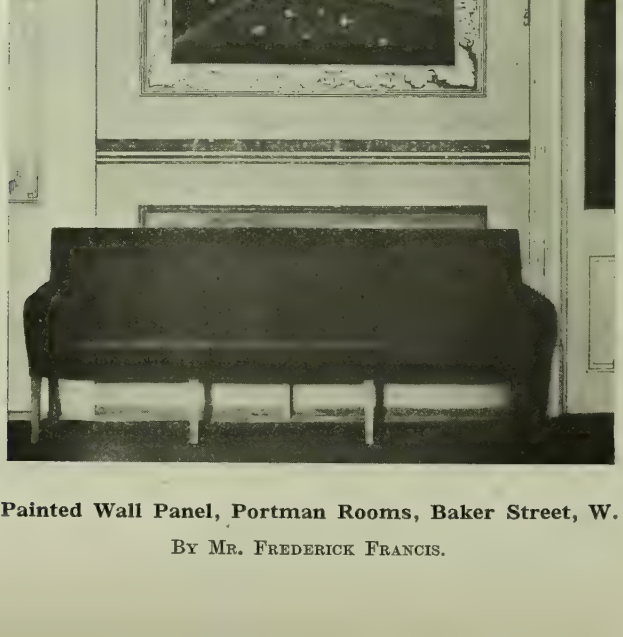
ARCHITECT'S ACTION FOR FEES

A CASE of interest to architects and builders came before Judge Chetwynd Leech at Clacton-on-Sea County Court on Tuesday, November 1, when H. W. Wrightson, an architect, of Carnarvon-road, Clacton, sued G. W. Hayden, of "Sylvamere," Thorogood-road, Clacton, for £28 9s. 11d., architect's fees. Mr C. E. Jones appeared for plaintiff, and Mr. David Field for defendant.



Outlining the case, Mr. Jones said that early in 1925 Mr. A. W. Field, a Clacton builder, saw plaintiff regarding extensions and alterations to "Sylvamere." Plaintiff saw the defendant and discussed plans and sketches, and drawings were prepared. The defendant said he did not wish the alterations to interfere with the Easter rush of visitors, and ultimately instructed plaintiff to complete the plans and drawings and to get them passed by the local authority. This was done, and the builder, Field, was instructed to do the work on the basis of a profit on the gross cost. Plaintiff was given no formal appointment, but was asked to get out an agreement between defendant and Field, the builder. In this agreement plaintiff was mentioned as the architect, and, when prepared, it was taken to the defendant, and after alterations had been made, Field signed it and it was taken to the defendant for signature. During this time the work was proceeding in order that it might be completed by Easter. Defendant kept the agreement some time, and then returned it to plaintiff unsigned. In July, defendant disputed Field's account and said he would refer the matter to the arbitration of the President of the R.I.B.A., and later plaintiff replied that in order that he might take such steps as he thought fit he must resign his commission.

Plaintiff, giving evidence in support of his claim, said he was a Licentiate of the R.I.B.A. There were a number of interviews between defendant and himself, and he prepared the plans to defendant's instructions. It was defendant's suggestion that Field should do the work on a cost, plus percentage basis. An agreement was prepared and signed by Field and left with defendant, who later returned it unsigned. Witness had charged 5 per cent. on the cost of the work—£313 3s. 10d.—half the amount he was entitled to charge. From time to time defendant made payments to Field, and he regularised them on the last payment by giving a final certificate for the work.

Alfred W. Field, a builder, gave evidence of carrying out the work. Defendant did not give the actual order for the work—that came through the architect, the plaintiff.

George William Hayden, the defendant, denied he had suggested an agreement; that he had asked plaintiff to prepare an agreement; or that he knew plaintiff was connected with any arrangement regarding Field. He had a verbal agreement with Field for 10 per cent. on the prime cost.

Giving judgment, His Honour said the question he had to determine was whether plaintiff was employed by defendant, and he was quite satisfied that defendant did employ plaintiff in his professional capacity. He had heard the evidence, and he thought plaintiff's evidence was corroborated by the documents produced. He had come to the conclusion that plaintiff's charges were fair and reasonable, and there would be judgment for plaintiff for the amount claimed with costs.

INSTITUTION OF HEATING A VENTILATING ENGINEERS

At a sessional meeting at Caxton Westminster, of this Institution, on ber 2, Mr. W. C. Freeman read a p "The Production and Modern Appl of Dissolved Acetylene." After de the chemical composition and meth storage, he dealt with the methods burning, or means of fusing together more pieces of lead. Lead burning, was considered to have commenced country about 1837, due to the inve the first aero-hydrogen blowpipe for t genous welding of lead by a French e de Richemont. It was probable t invention led up to the design a struction of subsequent oxy-coal ga hydrogen and oxy-acetylene blowpipe discovery marked an epoch in the hi lead-burning, as it enabled a localis temperature flame to be directed o welded joint, thereby reducing e and contraction of the base of th to a minimum. Further improveme place about 1895 when commercial was first manufactured, and enab manual compressor to be dispensed w again, in 1905, when commercial h was manufactured by the electrolytic In 1923 the acetylene-air flame wa duced, and led to the development oxy-acetylene blowpipe utilising acetylene and oxygen.

Practical demonstrations of methods were given by Mr. E. B. Pa A.R.S.I.

PORT OF THE CATHEDRALS COMMISSION

Report of the Cathedrals Commission,* last week, though to a large extent up with matters of constitution and tration, contains many suggestions hitectural interest, the most im- of which relates to the proposed ad- o Westminster Abbey, for the purpose nmodating monuments and memorials. anding Committee, under the Chair- o of the Archbishop of York, included er of Church dignitaries and others, Valter Tapper, A.R.A., P.R.I.B.A., member.

regard to the Westminster Abbey ls, the Sub-Commission I, in a Sup- ary Report on Monuments and als, state that they have unanimously some preliminary conclusions, which follows :—

atever provision it may be possible for future memorials in the Abbey, ider that, save in circumstances which n may regard as quite exceptional, ument or other memorial should be until at least ten years have elapsed e death of the person whom it is de- commemorate. Such a rule, we nd, already governs the erection of in public places in London and the ce of portraits in the National Gallery. If it were applied to the it would tend both to restrict the and to enhance the dignity of ls erected within it.

are convinced that no further space he Abbey itself is now available or made available for memorials. Like al Commission of 1890, we are opposed olicy of removing existing monuments. inappropriate and artistically un- some of these may seem to be, they eir place in the history not only of ey but also of English life and art. e past, deans and chapters, following ions of their day, had pursued this ne Abbey would not now possess that d sequence of illustrations of monu- rt which is one of its chief treasures. r, it is certain that any proposals for oving of monuments would arouse ntroversy without obtaining any ade- lvantage. The fate of proposals to he Burgess monument in St. Paul's l in 1897, and the Cornewall monu- the Abbey in 1902, affords sufficient

Nor do we consider that, apart asional and very exceptional cases, a ement and re-placing of existing its would be desirable. Here, also, sy would be aroused. The monu- e related to their surroundings. The ich might thus be secured would not the cost and trouble of securing it. ggestion has been made that space found for memorial inscriptions on l floor of the Abbey; but we con- t the danger of attrition by the feet ntinuous flow of visitors makes this n very unsatisfactory.

s also, not unnaturally, been sug- hat the existing Cloisters might be oubtless for a certain class of memo- wall space might be used in the in the past; but, apart from other s, the number and character of the s already placed in the Cloisters his site unsuitable for the com- on of the great men for whom some d dignified place should be secured. e is no other church which could in e be substituted for the Abbey as centre of the nation's remembrance strious dead. It is indeed fitting that 's Cathedral, where Nelson and n were buried, should be used in the future as in the past for the commemoration of great sailors and soldiers; and it would still be an honour to eminent artists that their names should be linked with the goodly company of great artists who have been buried or commemorated there. But not even St. Paul's can claim the unique traditions and associations of the Abbey.

"We dismiss at once the idea of building some Hall of Fame on another site. The representatives of the national life who gave us their counsel were unanimous in rejecting any such proposal. We believe that their opinion would be emphatically endorsed by the public opinion of this country and of the Empire. A hall of this kind, whatever its architectural merits might be, lacking all the profound associations, historical and religious, of the Abbey, would be a mere empty shell—a body without a soul.

"In view of all these difficulties, it has been suggested that the Abbey as a place of national memorial might now be regarded as closed, 'an expression of the feeling of the past,' and that for the future our great dead must find sufficient commemoration on the walls of the National Portrait Gallery or in the pages of a Dictionary of National Biography. We regard this as a mere counsel of despair.

"We are thus driven to the conclusion that, in order to meet the urgency of the problem, a new building ought in the immediate future to be erected within the Abbey grounds and in close connection with the Abbey Church.

"It seems to us that there are now only three ways in which the need can be met—viz., utilising (*a*) a site adjoining the Great Cloister, known as the site of the old Refectory; or (*b*) the ground on the north side of the Nave Aisle; or (*c*) the ground adjoining the Chapter-House.

"The first of these schemes was the one on the whole most favoured by the Royal Commission of 1890. But, in spite of this opinion, we cannot regard it as satisfactory. It is open to the grave objection that the site has already, since 1868, passed into the hands of Westminster School and could only be rebought at a great cost; that any new chapel or cloister erected on it would be, as it were, buried out of sight—invisible from any outside point of view among the Abbey buildings; and, above all, that it would be too remote from the Abbey Church. We proceed to deal with the other two schemes.

"I *A New North Aisle.*—This, it is proposed, might be built in the grass space stretching from the North Transept to the West Front, adjoining and accessible from the existing North Aisle of the Nave. This is the scheme specially associated with the late Mr. Pearson. Although it was rejected by the Royal Commission, there are many strong considerations which may be urged in its favour. It would provide enough space for memorials for many centuries. It would not violate the architectural traditions of the Abbey. Scarcely one of the original stones is now visible in the North Front of the Nave. In former days the design of this front was much more elaborate than it is now. There was a large Galilee Porch ending the North Transept; and on part of the space on which the proposed memorial aisle would be built, at the angle of the North Transept and the Nave, there stood a large thirteenth century Sacristy. The new aisle would not reach higher than the Triforium of the Nave. Such a building, it is claimed, would be in full harmony with the French associations of the Abbey architecture, and would resemble similar features in the Cathedrals of Notre Dame at Paris and of Amiens. Above all, the new aisle would be at once an integral part of the Abbey Church itself to a degree unattainable by any other scheme. In this most important respect, in the opinion of Lord Crawford, 'no alternative site is comparable with it'; 'it remains the ideal scheme.'

"On the other hand, such a scheme could not but seriously affect the lighting of the Nave. It would entirely change the aspect of the only part of the Abbey where the design is visible in one unbroken front. This is the view of the Abbey familiar for generations to the people who pass by it continually. It seems more than probable that popular opinion would regard any such complete change in the long-accustomed aspect of the Abbey with dislike, if not resentment. It was this consideration which led Lord Crawford, in spite of his conviction as to the intrinsic merits of the scheme, to confess that he thought it 'could not be sustained.'

"With regard to this proposal, we are not wholly in agreement among ourselves. Some of our number are greatly impressed by its merits. While recognising the force of the objections to it, they consider that it ought not to be passed over. They desire that the Dean and Chapter should submit it with the plans and sketches prepared [in 1890] by Mr. Pearson to the judgment of some eminent architectural assessors, and, if it be thought fit, to such representative bodies as the Royal Institute of British Architects or the Fine Arts Commission. They think that, if expert opinion pronounced strongly in its favour, popular opinion might be educated to understand and appreciate it, and that it has to be remembered that the building would be not for this generation only but for many generations to come. Others of our number are strongly opposed to the proposal. They consider that, even apart from possible expert opinions in its favour, the popular objections would be so great and certain that to arouse them would be to prejudice public opinion against any attempt to preserve the Abbey as a centre of national memorials. But they so far concur with their colleagues as to be willing that the Dean and Chapter should take advice as to the architectural merits of the scheme, provided that this measure of concurrence is not to be regarded as implying on their part any approval of it.

"II.—There remains what may shortly be called the *Chapter-House site.* The idea is to use the site between the Chapter-House and Old Palace Yard, and there to erect a building running parallel to Henry VII's Chapel consisting of an ambulatory round the Chapter-House, and a series of cloisters between it and Old Palace Yard. In considering this proposal we had the advantage of seeing some rough sketches and plans prepared by Sir Herbert Baker.

"There are, of course, to this, as to every conceivable proposal, certain obvious objections. The building would seem to be detached from the Abbey Church and its worship. It might interfere with the at present open view of Henry VII's Chapel and the Chapter-House, and with the grouping of these buildings and with the Abbey itself. A long cloister with few pillars and recesses to relieve the wall space might be somewhat monotonous.

"Against these objections it may be urged that a very direct access from the Abbey Church could be obtained from the South Transept at the Poet's Corner; that, if the elevation were kept low, the building would not seriously spoil the view of the Chapter-House (not in itself externally one of the most beautiful of the Abbey buildings) and Henry VII's Chapel, and might even enhance the interest and beauty of the grouping of these structures; and that a skilful and imaginative architect could be trusted to devise means for relieving any monotony. And, in further support of the proposal, it may be urged that it would have the great advantage of an entry from a wide street; that it would involve less than any other scheme any interference with the existing fabric of the Abbey or its dependent buildings; that it would provide ample space for the future; and that it would probably excite the least controversy and secure the most support. For these reasons Lord Crawford described it as 'the simplest solution.'

"We are unanimously of opinion that a

---

of the Cathedrals Commission appointed nce of a resolution of the National of the Church of England. Parts I. port and Appendices. London: Church Church House, Westminster, S.W.1, and r Promoting Christian Knowledge, 9, rland-av., W.C.2. Price 5s. net.

scheme on the lines thus indicated would satisfactorily meet the need of a place of national memorial in close association with the Abbey, and might even enrich the Abbey by the addition of a beautiful building in full harmony with its surroundings. We think it right to add that in our judgment part of the proposed building should be a chapel, not of such size as to constitute anything like a rival church, but a quiet place of prayer and remembrance which would, as it were extend and continue the religious atmosphere of the Abbey itself. We suggest that the Cloister should be glazed so as to give it what has been described as 'a sense of comfort and interior' and to express the intention that it should be regarded as a part of the Abbey Church. We therefore recommend that the Dean and Chapter should ask Sir Herbert Baker or some other eminent architect to prepare plans for a building on this site.

"To sum up, we consider, subject to the reservation already stated, that expert opinion should be obtained about the suggested new North Aisle; and we unanimously consider that if the objections to this proposal, expert or popular, prove to be insuperable—some of us would say quite apart from this proposal—a building on the Chapter-House site would, if rightly planned, prove to be a most satisfactory solution of the problem.

"With regard to the cost of these two schemes, there is no doubt that the first would be considerably less expensive. It has been very roughly estimated that the cost of the first might be about £50,000, and that the cost of the second might be as large as £150,000 or even £200,000 if it were to be at all worthy in structure and ornament. But we believe that the second scheme, particularly if a special place were found within it for past and future 'builders of the Empire,' would be likely to win a large measure of support not only in this country but throughout the Empire. We received assurances from Mr. Amery, the Secretary for the Dominions, that the Prime Ministers of the Dominions, especially of Canada and Australia, were much interested in the matter; and he personally thought that a scheme on the lines of Sir Herbert Baker's suggestions would appeal to the imagination of the whole Empire.

"We cannot conclude this Report without emphasising once again the extreme urgency of the problem before us. We repeat that the time has now come when the nation must decide whether or not Westminster Abbey is to retain the place it has held for centuries as the shrine of the nation's memories of the great men and women who have given noble service to the British Commonwealth, to science, literature, and art. Delay in making this decision is no longer possible. We cannot doubt that if a wise, well-considered, and bold appeal is made to preserve the special place of the Abbey in the nation's life and history, it will touch the hearts and win the support of the people of this country and of the Empire, and of our kinsmen in the United States of America, who look upon our Abbey as part of their own national heritage."

We extract the following particulars relating to the preservation of the fabrics of various cathedrals:—

Southwark Cathedral: A sum of about £5,000 must be spent on the fabric chiefly by way of repairing corroded stonework. £500 should be spent annually on the maintenance of the building in good repair and order.

St. George's Chapel, Windsor: Subvention of £1,000 a year needed for fabric maintenance. Mr. Harold Breakspear, consulting architect.

St. Paul's Cathedral: "It is not a case of there being no anxiety, for there is plenty, and it is acute. But, after seeking guidance from His Grace the Archbishop of Canterbury, we were agreed that we had better leave the whole question in the eminent hands to which it is entrusted."

St. Alban's Cathdral: Reparation of outer stonework in progress under direction of Mr. Oldrid Scott.

Rochester Cathedral: Organ to be refitted and enlarged at cost of about £3,000. "Drastic attention" needed to leading and timbers of roof and aisles, etc. Cost, over £13,000. Professor W. R. Lethaby, architect.

Chichester Cathedral: Fabric in "good trim." £6,500 laid out since 1921 on furnishing of various chapels.

Chelmsford Cathedral: Chancel about to be enlarged by two bays as memorial to the late bishop.

Canterbury Cathedral: Sum of £137,000 required for expenditure on fabric, of which £103,789 represents work which it is desirable to put in hand without unreasonable delay. Mr. W. D. Caröe, architect.

Manchester Cathedral: Fabric in good condition. Sir Charles Nicholson, consulting architect.

Norwich Cathedral: Fabric fund between £9,000 and £10,000. Sir Charles Nicholson, consulting architect.

Ely Cathedral: Roofing repairs to cost £6,000. Fabric in charge of Mr. Ladds.

Peterborough Cathedral: £10.000 needed for immediate work, and £10,000 for work that cannot be long postponed.

Ripon Cathedral: Fabric appears to be in very good order.

Newcastle Cathedral: Condition of fabric appears to be good.

Durham Cathedral: Fabric generally in excellent condition. £25,000 to £30,000 required during next twenty years.

Carlisle Cathedral: Fabric appears to be on the whole in good condition. Vestries required to be provided. £1,000 per year required for repair of fabric, etc.

York Minster: Fabric in a satisfactory condition. £3,000 a year spent on repairs. Mr. Walter Tapper, architect.

Chester Cathedral: Fabric in good condition, though much needs to be spent continually upon it.

Wakefield Cathedral: Considerable repairs to be done to the roof. £5,000 required.

Lincoln Cathedral: Undergoing extensive and lengthy repairs. £65,000 recently raised in England and America; £21,000 more needed.

Gloucester, Hereford, Lichfield and Worcester Cathedrals: In all cases fabric is being carefully looked after; resources of the cathedrals not sufficient to do all that is required.

Birmingham Cathedral: Difficult to raise money for building a cathedral worthy of the city or for its endowment. Large sums required for church extensions.

Wells Cathedral: "Extraordinary" fabric repairs to west front being undertaken. £3,000 now asked for.

Bristol Cathedral. Fabric in good condition generally. £400 required annually for repairs. Mr. Rowland Paul, F.S.A., architect.

Exeter Cathedral: Fabric structurally sound. £1,500 per annum required for repairs.

Salisbury Cathedral: £1,200 to £1,500 a year spent on fabric. Sir Charles Nicholson and Mr. W. A. Forsyth, architects.

Under the heading of "Fabric, Fittings and Ornaments," the Committee states: "It is too obvious to need any emphasis that a first duty of the authorities of a cathedral is to keep it in being; in other words, to give constant care to the maintenance of its fabric." Having referred to the "immense and increasing difficulties which beset the fulfilment of this duty by reason of the financial position of almost every cathedral," the Committee proceed: "Here it is sufficient to say that in our judgment, in regard to questions affecting fabric, fittings, and ornaments, including monuments and memorials, authority should lie in the Chapter. The Chapter should always have a competent consulting architect, who should inspect and report upon the fabric at regular intervals, and whose advice should be obtained by them, not only as to the condition of the fabric, but also as to the fitness of all ornaments, furniture, monuments, or memorials, offered to or placed in the cathedral."

THE NEW P.R.I

Mr. Walter Tapper, the new P the R.I.B.A., was born at Bov Devon, and served his articles wi Rowell & Son, at Newton Abbot. expiration he came to London, a short term as assistant in the of Basil Champneys, he joined th Messrs. Bodley & Garner, and was assistant for many years. Bodley at that time were at the zenit career. The experience gained great masters was invaluable. was mainly in the country, and br assistants into touch with th builders and their traditional building. The practical side of ing has been of great value in M own practice. He spent his spare t ing and measuring old work al country, and also at the South Museum.

In 1900 Mr. Tapper commence He became a member of the A Association, and was a memb Council and Vice-President. H by voluntary examination for A of the R.I.B.A., and later was Chai Art Committee, and Member of for some years. Mr. Tapper's wo of a varied kind, ecclesiastical an the former predominating. All sional life he has been an sketcher and measurer of old wo home and abroad. Mr. Tapper A.R.A. in 1926. He holds the a of consulting architect to York Manchester Cathedral.

WEEK IN PARLIA

Housing Progress.

Replying to questions from Sir and Mr. H. Williams, Sir Kingsley that during the six months end ber 30 last, 134,500 houses were under the Housing Acts, as com 78,416 in the preceding six mo numbers completed by private ente out subsidy during the same p 27,663 and 32,650 respectively. C and four schemes dealing with slu been confirmed. Those schemes proximately 14,000 houses, of had been acquired by October demolished. Tenders for the 7,776 houses, in satisfaction of the obligations imposed by those sc been approved at that date, and actually completed.

Local Authorities and the S

Mr. W. Baker asked the Minist whether he was aware that, as a inclement weather during the p the Bristol City Council had bee complete its programme, and hou was hoped would be entitled to sidy; and, having regard to the sentations which he had receive authorities, would he consider t steps whereby an extension of ti granted to enable the houses to full subsidy?

Sir Kingsley Wood said that had received a communication Bristol Town Council about the number of houses completed by l ties during the past summer was in excess of the number complete previous summer. The number o tified by all local authorities in Wales as completed by them duri months ended September, 1927, as compared with 19,660 in the c period of 1926. The total nu assisted houses certified as comp month of September last reach precedented figure of 52,000. Bristol, the number of houses c the Town Council during the t ended September last was 501 figure for the corresponding thre 1926 was 323. The Minister h to grant any extension of time.

seems proved to me by considerations
nd Furtwängler's reasons: the likeness
ıe girlish type of figure and face to the
d Athena of the East frieze; the close
nblance to the Athena of the western
e with her diagonally worn ægis; and an
ity with Myron's Athena." Lechat re-
s on a certain resemblance of the central
of figures of the west pediment to
on's group of Athena and Marsyas; and
recently Mr. C. K. Jenkins has argued
Furtwängler's Lemnian is so like
on's Athena that the former was probably
ork of Myron too (*Burlington Maga-*
, October, 1926). The special points of
nblance between the "Lemnian" and
Athena of the west gable are the attitude
pose of the head; the drapery, both in
ion and treatment; the thrown-up arm,
sing the armpit with part of the side—
pare also Demeter in the east gable; the
onally-worn ægis, with scalloped edges
little knots of serpents; the gorgon's
l on a circular disc set in its centre on
breast (compare also the shield of the
henos); the feet with thick sandal-soles
earing beneath the tunic. So far as
yle" can prove authorship, I claim that
s proved that Furtwängler's "Lemnian"
ndeed a work by Pheidias. In Fig. 5

Fig. 5.

ve a sketch restoration of the head and
lders of the west gable figure. The
et is restored from another Athena of
dian type at Dresden (compare *Greek*
dings, 1908, and *Burlington Magazine*,
).

e Athena of the west pediment, as the
ments show, had many additions of
ze: snakes and a gorgon's head on the
, earrings, a neck-piece to the helmet,
perhaps curls of hair. I cannot see such
resemblance with Myron's work; indeed,
ould say that both were not by the same
t. On the other hand, some English writers have argued that Furtwängler's "Lemnian" was not even Athenian. Works which do seem to me to resemble one another very closely are: this figure, the Parthenos, the figure of Athena from the W. pediment, and other of the pedimental sculptures, especially in the flesh treatment of nude arms, the Athena of the E. frieze. The likeness between the supposed "Lemnian" with these is to me convincing. A part of a colossal foot is in the Museum (336). As the *Guide* says, it can hardly be any other than the right foot of the Athena of the west gable, although "it has lately been ascribed to the E. pediment." A part of a colossal foot was classed by Ellis (1833) with the fragments from the W. pediment. Fragments of the central olive tree have been found. Athena's opponent, Poseidon, was a great nude figure with extended arms. According to the *Guide*, "behind the left shoulder-blade are remains of a protuberant surface not yet explained." This must have been the attachment of a cloak which passed across the back to the arms, giving them support. In the small plaster restoration exhibited in the Museum, the right arm has support by the olive tree, but his left arm has none. The central part of the pediment was divided from the angles by a fine chariot group on either hand. Each had two horses, a charioteer, and a running groom. The horses on the right had fallen out of the pediment before records of the sculptures begin, but considerable fragments of them have been found. The chariot group on the left was drawn by the artist of 1674. In the Museum *Guide* of 1908, one of the charioteers is said to be seated; of the other it is observed: "This figure was not seated, as Carrey probably conceived it, but must have been standing with the body thrown back, like No. 46 in the north frieze." Not, I think, like that either, but rather like the man who is alighting from a chariot, No. 50. One leg was obviously at a much higher level than the other, the foot on the floor of the chariot, while the other dropped clear at the back. Both charioteers were in this attitude. The horses had been suddenly checked, drivers step off, leaning back as we do from a bus, and grooms rush forward to restrain the restive teams. Dr. Murray remarked that the ears of the horses of Poseidon were "pricked forward strongly to indicate sudden surprise." The horses of Athena had their ears thrown back. Wheeler, who saw the left-hand group before it fell, said: "The horses are made with great art, such a vigour is expressed in each posture of their prancing and stamping." Everything expresses startled surprise and sudden arrest.

It has been said that "the actual chariot was not indicated, but left to the imagination." Surely this is so unlikely that it needs proof, and the evidence seems to suggest a different conclusion. These pairs of horses, with their actions, related to two chariots and drivers holding reins, would be rather absurd if the chariots were not there. In the drawing of 1674 a ledge appears under the raised right foot of Athena's charioteer, which can hardly be anything other than a fragment of the floor of the car. The wheels were probably added in bronze; some of the metopes had chariot wheels of bronze. On the fragments of the chariot horses which have been discovered appear "perforations for the attachment of trappings of metal." In the German restoration of the chariot groups in the pediment at Olympia are complete chariots with wheels. Altogether we may determine that it was so at the Parthenon. The charioteer of Athena was probably a winged Nike. The large fragment of an arm (330) may have belonged to this figure; as was suggested in the *Guide*, it is in a driving pose. The Laborde head has also been assigned to it by some scholars.

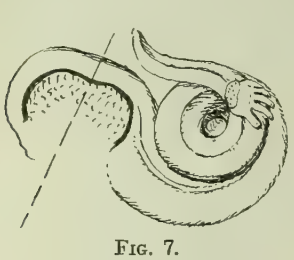
Fig. 6.—From Eleusis Relief.

Fig. 6 is a sketch of a head from the Eleusis relief for comparison with the Laborde head. The creases on the neck are characteristic of Pheidias. A fairly sure drawn restoration of this chariot group might be made.

The driver of Poseidon's chariot, generally known as Amphitrite, must have been a most noble figure. Enough is left to show that the drapery was blown back against and from the body. In 1812 it was brought down to the floor, and it was then possible to make out the arrangement of the scarf on her shoulders. From the right shoulder it crosses the back under the left arm, and then up to be thrown over the left shoulder, where it probably fluttered in the wind; part of its function was to furnish support to the arms of the figure. The drapery of this figure, and its companion Iris, is particularly clinging—perhaps it was imagined as wet from the sea. The treatment of the drapery and bodily forms under appears to me very similar in style to the workmanship of the great reclining figure of the E. pediment, and I could think that both were the work of one artist, notwithstanding Schrader's arguments that the sculptures of the two gables are of different styles.

The attendant on the chariot of Poseidon was a winged female now generally called Iris. The beautiful torso which remains was for a century placed in the east pediment. Brunn as long ago as 1874 pointed out that it must have been the figure shown by Nointel's artist in the west pediment, a view that was reinforced by Furtwängler and others. After further delay of many years the question was looked into, and it was found that the eastward position was founded on a mistake of Visconti's (see *Sculptures of the Parthenon* and recent *Guides*). In Ellis's little Handbook of 1833 we are told that the left knee of a colossal statue was found at the west front. This was probably the same knee which Watkiss Lloyd in 1860 showed belonged to Iris and which in 1875 (we move slowly) was fitted to it. Enough remains of this noble figure to show that she was running. The head remained in 1674, and the drawing of that time indicates that her right arm reached forward to grasp the horses, the left was thrown backwards and was supported by drapery. Furtwängler speaks of "a fragment with large folds still extant" as part of this (? 337). In the existing shoulders are joggles where wings were attached. A restored drawing of this figure might be made. The figures to the right and left of the central action, it is agreed, were witnesses of the appearing of the gods. Near the middle of the left-hand group is a pair of closely associated figures of an aged man and a frightened maiden who clings to him. The man is now generally accepted as Cecrops, and the maiden is his daughter. Between the two figures, according to the *Guide* of 1908, "on the ground is a convex mass which is part of the coil of a large serpent." As already said, it was Watkiss Lloyd who fitted on a fragment that had been anciently attached here by a joggle, and proved that the mass was a serpentine coil. He could not get the obvious fact accepted, and in 1861 protested that "the application

of the marble fragment was a prime restoration authentic by simple inspection, and grievously damaging the perspicacity or the candour of those who doubt or misinterpret." Nearly twenty years ago I showed that the serpentine coil was in fact a tail proceeding from the man's body, and that he was seated on it. It "grows bigger nearer the man until the coil, getting vertical, disappears under the centre of the man's back" (Fig. 7 is a plan).



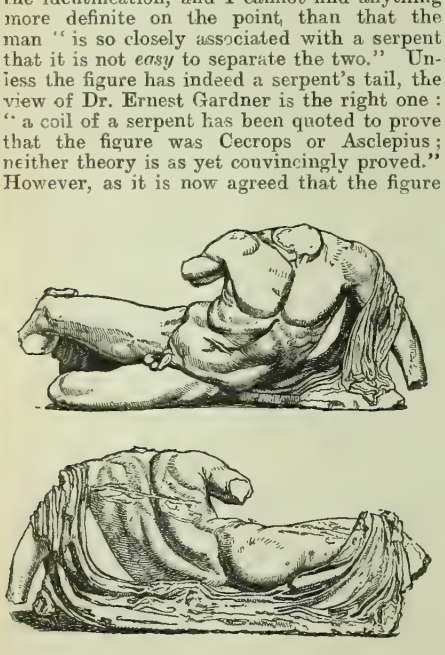


FIG. 7.

Following on Watkiss Lloyd's discovery, it had been supposed that a separate snake, of which the head was lost, was represented, and Michaelis, the great authority on the sculptures, accepting that view, identified the man's figure as that of Asklepios. Others more irrationally, while separating the serpent from the man, yet called him Cecrops. By attaching the coil as a tail to the man's body he becomes Cecrops the serpent-man with certainty.

In *Sculptures of the Parthenon*, 1910, the identification was still regarded as doubtful. More recently, however, as in the *Guide* of 1925, we are told that "Cecrops the half-serpent king is alone certain." Until it is agreed that the serpentine coil is attached as a tail there is no certainty whatever in the identification, and I cannot find anything more definite on the point, than that the man "is so closely associated with a serpent that it is not *easy* to separate the two." Unless the figure has indeed a serpent's tail, the view of Dr. Ernest Gardner is the right one: "a coil of a serpent has been quoted to prove that the figure was Cecrops or Asclepius; neither theory is as yet convincingly proved." However, as it is now agreed that the figure

FIGS. 8 AND 9.

is indeed Cecrops, we may as well accept the observation that he had a tail rather than "an associated serpent."

A precious original drawing made by Pars in 1765 of this group when the heads existed is preserved in the Museum. A photograph of it used to be placed near the group, but it has been withdrawn for many years. It was engraved for Stuart's work, but no facsimile of it has ever, I believe, been published. The drawing shows drilled holes in the heads of both Cecrops and the woman. In the latter case they may have been for a garland, but I have wondered whether those of the male head were not for the attachment of locks of hair in metal. The beautiful "Laborde head," which it is generally agreed came from the Parthenon, also has rivet holes for attaching a garland. Many or most of these figures must have had garlands. The garment of the woman companion of Cecrops is blown aside by the wind, and a part of it on the breast was undercut.

The heads of these figures seem to have remained until the beginning of last century. According to Lord Aberdeen, the head of Cecrops was in 1803 intentionally knocked off, and falling, was broken to pieces. (One of the causes of the destruction of the sculptures was a custom of firing at them. Some parts of the E. frieze are pitted with bullet-marks, and "one or two bullet-marks are observable on the figure of Dionysos of the E. pediment.")

The two figures between this chief group on the left-hand side and the angle of the pediment were the reclining male figure in the Museum (Figs. 8, 9), and a crouching male, the torso of which, only recently identified, is at Athens. These are known as A and A*, and the latter is illustrated in Collignon's work. As before shown, they probably represented primitive Athenian rulers, and they seem to have been conversing together, or rather one called the attention of the other. The Museum guide well describes A thus:—"The general pose seems to indicate that the attention of the figure is partially aroused, but that he has not yet quitted the attitude of rest. The right hand probably held an edge of drapery over the right knee. The ground on which the figure reclines is a rock." The rock must be the Acropolis, and this fact alone should rule out the name Ilissos. The drapery which hangs from the shoulder of the figures possibly flaps in a wind. The pose and sudden gesture suggests to me that the man awakes from sleep with a start, throwing back a covering and turning on his side. On a drawing of this figure by Pars it is suggested that the left hand of the figure overlapped the edge of the cornice, but this is doubted. Certainly parts of some of the sculptures projected in this way. A small restoration of the figure a century old in the Soane Museum is quite good.

On the right-hand side of the pediment Erechtheus and his daughter corresponded in position to Cecrops and his daughter in the left-hand group of spectators. Between this right-hand pair and the central action were, as on the other side, two women and a nude youth—daughters and a grandson of Erechtheus. The nude bodies of youths, one in either half of the pediment, in balancing positions, their smooth surfaces shining in front of fully draped matronly figures, must have been important factors in the composition, high lights, as it were. Portions of the body of the youth on the right were identified by Sauer, and the fragment of a right shoulder in the Museum (338) probably belonged to it. (Fig. lxx.)

In the Museum is also a large part of the draped right thigh of his mother. Dalton's etching of this pair of figures renders their attitude better than the drawing of 1674 (see *Burlington Magazine*, 1915), and a restored drawing of them could very well be made. Of the woman who was next, a large part is in the Museum, and the complete figure is shown in the old drawing. Her drapery is much fluttered by wind, as was pointed out by Watkiss Lloyd; Furtwängler may be right in taking this as a sign that she is Oreithyia, but the blast, I cannot doubt, is the same as that which blew throughout the pediment, and was occasioned by the appearance of Poseidon.

The pair of figures in the right-hand angle of the pediment—a reclining maiden and a youth in a crouching or rising attitude, I have suggested should be identified as Kephalos and Procris. As we are told in the *Guide*, "the manner in which these figures are associated suggests an intimate relation between the two." The figure which I suppose to be Kephalos is sometimes described as "sitting down on his heels. He was rising, rather; his left thigh is much higher than the other, and the knee was thrown up, while the foot would have been brought forward. The left hand pressed the ground, while the right was lifted high as if grasping some spear or rod. The action was that of "getting up," a significant action, for Kephalos went hunting at dawn. The reclining female figure turns on her elbow as if awaking from sleep. Quatremère said of the reclining male in the left angle "he looks as if he would rise—he is rising." This is equally true of the figures in the right hand angle. Procris (as I call her) turns on her elbow, and this may have been an understood indication of waking.

> "O Hector! on thine elbow rise,
> Unhood the eagle of thine eyes."
>
> (Rhesus.)

That the contest of the gods was at sunrise is suggested by the reclining and waking attitudes of the spectators. These people were sleeping out of doors when it all happened. There is nothing grotesque in the thought that primitive people in a far-off age were sleeping out of doors on the Acropolis. In the *Iliad* Nestor is found sleeping outside his hut, having his sceptre with him; so also Diomed and his companions. Says an editor's note—"evidently this was a hot night." On such a morn Athena and Poseidon appeared to men. The suddenness of the action and the fright of the spectators is insisted on. The visitation of the gods was for a moment only and they were gone. A blast of wind went with the stroke of Poseidon's weapon, and the effects of the gust is a unifying motive throughout this western pediment, as the shout of Athena was of the other.

Additions of bronze have been spoken of in regard to the central group, and there were doubtless many accessories—sceptres, spears, diadems — added to the side groups. The figure of Cecrops has his right arm raised and he probably held a long sceptre. The balancing figure on the other side of the pediment would have had a similar long attribute, and we have seen that Erechtheus on the Hermitage vase has such a long sceptre. Every little detail seems to confirm the Leake-Furtwängler theory of interpretation. The figure of the youth rising from a crouching position, which I would call Kephalos, probably held a hunting spear or pair of spears. Some corresponding shaft or sceptre might have been held by the second figure on the left (A*). Such long lines inclining at suitable angles would greatly have helped the composition, and we have had evidence of the use that was made of them in the eastern frieze. We may see from the excellent German restorations of the pediments of the temples at Ægina and Olympia how much the addition of suitable accessories enlivened great sculptural groups. The whole was finished and brightened with colour and gilding.

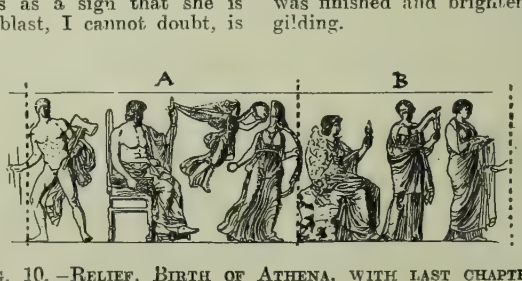

FIG. 10.—RELIEF, BIRTH OF ATHENA, WITH LAST CHAPTER.

THE LONDON BUILDING ACTS AND THEIR APPLICATION—XXXIV

By H. V. MILNES EMERSON, A.R.I.B.A.

regulations as to the procedure to be
d in cases of appeal and the fees to
d can be obtained from the office of
ribunal, No. 13, Great George-street,
inster, S.W.1. Generally, all com-
itions must be on foolscap paper, and
wings on tracing linen, in duplicate,
e appeal must be made within the
(if any) prescribed by the Act, and
no period is so prescribed, within
s after the decision, etc., has been
on the appellant. The hearing of
s is open to the public, and the
interested may appear before the
al either in person or by counsel,
r, or agent. The procedure at the
g is generally as follows:—

iminary objections, if any, to be
and disposed of.
llant to state his case and call his
es.
ondent to state his case and call his
es.
other parties interested to be heard.
llant to reply.
decision of the Tribunal is embodied
rder in writing under the seal of the
al.

PART XVI.

Miscellaneous.

on 189.—This section deals with ex-
incurred by the Council.

on 190.—This section empowers the
to give their consent to any act
g under this Act and to impose any
and conditions, with such sanction
determine. Under this clause the
can impose any conditions they
and not always in favour of the
nt.

on 191.—Relates to historic buildings.

on 192.—Provides for power of entry
nises for the purpose of complying
y notice under this Act. This sec-
s rendered necessary in the decision
len *v.* Lester, 70 L.T., 348 (1894), in
it was held that a builder having
ed and left the premises, he could
enter the premises without the con-
the owner in order to fulfil the
ments of the district surveyor.

on 193.—This section limits the time
ceedings to be taken where work has
rried out without due notice to the
surveyor.

ons 194 to 199.—Relate to applica-
tc., to the Council, storage of timber,
eet obstructions.

on 200.—Deals with offences under
also Sections 6 and 7 of the London
g Act, 1894 (Amendment) Act, 1898,
with this section.

n 201.—Buildings exempt from Parts
VII of this Act, apart from Gov-
and other specified buildings, are:
gs not exceeding 30 sq. ft., and not
an 5ft. high from ground to under-
eaves, and 5 ft. distant from any
(fowlhouses, etc.).

ngs not exceeding 30 ft. high from
of wall, and not exceeding 125,000
et in extent, distant 8 ft. from the
nd 30 ft. from the nearest building
dary of adjoining owner, not being
building, and wholly in one occu-
If the building exceeds 125,000, and
exceed 250,000 cubic feet, it must
from the street and 6 ft. from the
building or boundary. Hence a
dwelling-house, complying with
nditions and to the conditions relat-
ing to foundations and sanitation, can be built without any regard to the constructional provisions from Sections 53 to 86 inclusive. Party fence walls, not exceeding 7 ft. from top of footings, and detached greenhouses, are also exempted. Greenhouses attached to buildings are exempted as far as the necessary woodwork is concerned.

Sections 202 to 207.—Deal with exempted buildings and the duration of exemption, etc.

Section 208.—Unless, in any case, the Council allow, where a party wall or external wall not in conformity with this Act has been taken down, burnt, or destroyed, to the extent of one-half thereof, measured in superficial feet, every remaining portion of the old wall not in conformity with this Act shall either be made to conform therewith or be taken down before the rebuilding thereof.

It has been held that in the case of a building burnt or taken down more than half its cubical extent, but the party wall taken down less than half its superficial extent, the remaining portion of the party wall need not be made to conform with the provisions of the present Act, sufficient not being taken down to bring it within this Section 208, Section 5, sub-section 6, being merely a definition section.

Crow *v.* Redhouse, 59 J.P., 551, 663 (1895).

Section 209.—Every addition to or alteration of a building and any other work made or done for any purpose into or upon a building, except that of necessary repair not affecting the construction of any external or party wall, shall, so far as regards such addition or alteration or other work, be subject to the provisions of this Act, and of by-laws thereunder relating to new buildings.

It will be noted that every addition or alteration, whether externally or internally, also all necessary repairs to external and party walls, also the rebuilding of parapet walls and chimney stacks, come within this section. It was stated recently by one district surveyor that the making of a hole in the external wall in connection with fixing the wireless aerial came within this section.

Section 210.—Deals with application of Act to buildings erected before commencement of Act. Briefly quoted is as follows (unless the Council allow):—

Section 211.—

1. No building or part of a building not originally constructed for human habitation can be converted into a dwelling-house.

2. Convert two or more dwelling-houses into one.

3. Convert one dwelling-house into two or more.

4. Convert a building legally exempted when erected from the buildings enactments in force into a building which, had it been originally erected in its converted form, would have come within such enactments.

5. Reconvert any building into a dwelling-house which had been discontinued as such.

6. Convert into or use as a dwelling-house in whole or part any room used as a shop.

7. Convert a dwelling-house in whole or part into a shop.

Unless the foregoing when converted will be in conformity with the Act relating to that class of property.

Sections 212 to 218 (inclusive).—Deals with buildings in course of erection at the passing of this Act, repeal of certain Acts, by-laws, etc.

GREATER LONDON TOWN PLANNING

The first meeting of the Greater London Joint Town Planning Committee, which was appointed as the result of a conference of representatives of local authorities in December last year, was held at the Ministry of Health. Mr. Chamberlain, Minister of Health, presided, and addressed the meeting. The Committee represents a region of 2,000 square miles comprised in a circle with a radius of 25 miles from Charing Cross.

Mr. Chamberlain referred to the formidable task before the Joint Committee, and said they would require great patience, good will, and courage to overcome their difficulties. The traffic problem in London had become so difficult that it was very questionable whether it was possible to find any solution which would be entirely satisfactory. It might be that all that they could do, beginning at this late stage, was to prevent it from getting much worse or in some degree to mitigate its most acute forms. Developments were going on all round London which offered still further to increase and to multiply the difficulties of internal traffic. The only consoling thought about the future was that the rate of increase of population was diminishing, and that in all probability there would come a time when the population as a whole would be stationary; and one might estimate that these difficulties would not continue to grow at the pace they had seen in the past. They had to set against that the fact that, concurrently with this fall in the rate of increase of population, there was a steady flow from the country into the towns. It would be conceivable that one might take a pair of compasses and describe a circle of any radius considered suitable and say that within that circle the population should not exceed a given number. He was doubtful whether it would work in practice, because the forces that tended towards the growth of a great city like London were so strong that it was difficult, if not impossible, to dam them out. What they ought to consider was how far and in what direction it was possible to guide and direct that growth. They had to aim at decentralisation, and the key to decentralisation was to be found by the shifting of the industries along with the people who were engaged in them. Speaking of the garden city movement, he said that one of the ideas of the garden city was that it should be a self-contained unit. One of the essential features of garden cities was that they should be surrounded by an agricultural belt. Should Greater London, he asked, be provided with something which might be called an agricultural belt? It would form a dividing line between Greater London and the satellite towns or fresh developments that might take place at a greater distance. They would have to consider the financial implications of such a policy. The agricultural belt might be partly agricultural, partly parks or playing fields, or even unbuilt-upon open spaces which formed adjuncts to such buildings as hospitals or private residences. With regard to zoning, Mr. Chamberlain said at present they had no legislative powers to town-plan areas already developed. Such legislation, however, was bound to come, and it could not be long delayed. It would be useful in their study of the problems of London if they paid some attention to zoning in a built-up area like London, and accumulated such information as might be of assistance to anyone who had to devise fresh legislation.

Sir Banister Fletcher, the representative of the City Corporation, was unanimously appointed chairman of the Joint Committee, and Mr. Harold Swann, London County Council, was appointed vice-chairman. A General Purposes and Finance Committee was also appointed.

Mr. Henry Ward's Estate.

Mr. Henry Ward, A.R.I.B.A. (73), of Bohemia-road, Hastings, left £10,728 (net personalty £10,277).

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Road Construction.

[REPLY TO "LAW," OCTOBER 21.]

SIR,—The section of the road and position of kerbs for the 200 yards are as shown in my sketch in your issue for August 26. The "road" has been and is being made up by the vendor of the estate—*not* by the local authority, but the sewering and kerbing have been done by the latter. The footpath, if and when made up, will be about 2 ft. above the natural level of the lower side of the site.

The local authority, in building up the kerb, battered it up with clay from the sewer excavation, considerable filling material, clay, and surplus earth from trenches in the neighbourhood has since been deposited, and the local authority is evidently not disposed to alter it. The result is, or will be, as shown in my sketch (August 26), making the low side houses and the building sites damp, the water pouring down through the entrance gates after every rain storm. The value of the property is depreciated by these altered conditions. Before the sewering and kerbing was done there was a 9-in. by 12-in. trench, one on each side of the road, that carried off the surface water from the road and footpath. These were filled in by the local authority when the sewer was laid. No notice of any kind has been received that the sewering and kerbing were about to be done, but payment for both, without details of expenditure being given, is demanded under a "local Act." As before mentioned, the road was not made up by an engineer, surveyor or contractor, and if, as shown, it has been made up to an improper height, should not the local authority correct this by lowering their kerbing to about the natural level, and thus avoid that drop of 2 ft., so that the dampness of the site and houses would not result?

DRYSITE.

Non-Slip Preparation.

[REPLY TO "ANKLE."]

SIR,—I should suggest one of the patent floor polishes which are of a varnish nature. There are a number of such preparations on the market, chiefly for labour-saving purposes, but they have also non-slip properties. Any good builders' merchant would recommend a suitable preparation.

Z. X.

Sound-Deadening.

[REPLY TO E. S.]

SIR,—I should suggest nailing sound-proof quilt, which can be obtained for about 2d. per square foot, to the ceiling joists, and covering same underneath with ceiling board supported by false ceiling joists. Quite a handsome effect could be obtained and the results would be thoroughly satisfactory. Allowing for 4 in. by 3 in. oak ceiling joists exposed, this work should be executed for about 14s. or 15s. per yard super.

TUDOR.

Ownership of Documents, etc.

[REPLY TO "LAW," NOVEMBER 4.]

SIR,—I thank "Law" for his reply, but may I ask under what statute and in what court could this claim be made or information laid? Is there a rule of court on this matter? I may say there is other matter in the books; they were not kept for this job alone.

Is there any instance of a clerk, commercial traveller, or person in a similar capacity being ordered by court to hand over his private books? What is in question is the power of the building owner to make this claim, and whence he gets this power. Copies of the entries relating to the work have been supplied by the clerk of works.

LANCASHIRE.

Reflections in Plate-glass Windows.

[REPLY TO ALFRED KING & SON, NOVEMBER 4.]

SIR,—So long as rays of light from illuminated objects fall upon a reflecting surface so long there will always be reflections; and these will blot out the view of objects behind the reflecting surface so long as the former are the more brightly illuminated of the two. The reflections can be minimised in effect by a discreet use of background, which should be light in tone; but the only possible way of getting rid of the reflections from the eye of the passer-by is so to tilt the reflecting surface as to deflect the image of the bright objects out of reach of the eye. This is extremely difficult in the case of a shop front, but there is no reason why the glass should not be tilted forward so that the actual reflection of the sky, which is the most disturbing reflection of all, is cast down too sharply to catch the eye of the spectator. In the case of the shop directly opposite a street, I should imagine it would be advantageous to splay the glass fronts so as to reflect the darker buildings on either side, the reflection of the bright street being cast off at an acute angle.

REFLECT.

Ancient Lights.

SIR,—I note that in a reply to S. S. in your issue for September 16, "Law" advocates the erection of a hoarding to obscure windows of adjoining buildings overlooking tenants' property. Quite recently a number of garages were erected at the end of my garden abutting the garden wall. These garages have windows which overlook my garden, and I presume, in the circumstances, that I should take steps to obscure the light. I am reluctant to adopt such a seemingly churlish attitude towards a neighbour, and it seems to me that the district surveyor, when approving the plans, should have pointed out that the windows in question would infringe my rights, and should not have given his approval until my consent had been obtained. To add to the annoyance, the flat roof of the garage is being used for the storage of lumber, packing-cases, old baths, etc., which constitute an eyesore when looking from any of the back windows of my house. Can I usefully take any action to prevent the roof being used in this manner?

A. A.

Basement Houses.

SIR,—Can you tell me whether it was the practice to insert a damp-course in basement houses built about 40 or 50 years ago? The type I refer to consists of pairs of semi-detached villas with the ground floors raised up about 4 ft. or so above the ground and the basement floor of kitchen quarters about 4 ft. below ground

VICTORIAN.

Contract Penalty.

SIR,—A builder has just completed an alteration job costing under £1,000 and is a few weeks over his contract time. My client is therefore deducting the penalty of a certain sum per week allowed in the contract. The contract was the standard R.I.B.A. one. There were a few extra works ordered to be done, and a fair time has been allowed to the builder for this. The builder will not accept the deduction of the penalty, and maintains that he had to wait for materials and could not get workmen to execute the work at the time. Would the client, therefore, be in order in deducting the penalties as above?

DUB.

Question of Maintenance.

SIR,—In a district in the Home Counties a question has arisen regarding a certain street just taken over by the Council. The occupiers have petitioned the Council to provide grass verges to the footways, and the latter have agreed to do so provided the occupiers undertake to maintain them in neat condition. Has the Council the power to demand this? Alternatively, in the eve the arrangement proving unsatisfactory the Council deciding to undertake the themselves, will they be empowered to c the cost to the occupiers concerned, o this be a charge on the rates of the district?

FRONTAG

Open Spaces in Front of Shops.

SIR,—A line of shops fronting on a street has been built back some ten feet the line of the public pavement, thr the extra space into the causeway. space has never been formally dedicat the public.

(1) Can the shopkeepers continue t this space for the display of goods sta in the open, without periodically enc the space with posts and chains or bar

(2) Can the shopkeepers ever enclos space again permanently, provided the ing line is not altered?

(3) Has the public a right-of-way ove a space?

B.

Steel Houses.

SIR,—Could you tell me the numb steel houses of the Atholl, Braithwait Weir types now under construction in land, and where these schemes are lo

INTERES

Zinc Roof and District Surveyor.

SIR,—Could you inform me if the d surveyor is entitled to receive notice, a obtain his fees, when an old zinc-cover roof is re-covered in a similar manne with similar material, without any a tion whatsoever?

SURREY QUANTITY SURVEYORS

The Standard Method of Measurem

At a meeting held at the Surveyors' tution, 12, Great George-street, S.W Monday, October 31, a discussion w augurated upon the Standard Meth Measurement. The chair was taken b Wilfred L. Evershed, F.S.I., who wa ported by the Vice-Chairman, Mr. Freemantle, F.S.I. In addition to the tity surveyor members, Mr. Chris Chart (Member of Council), Mr. Jo Rosevear (Vice-Chairman Surrey B and Mr. Thomas Brent (Hon. Sec. Branch), were also present.

The Hon. Secretary, Mr. Henry A. min, announced that in response to t cular many questions were sent him b these were tabulated, and the Ch opened the discussion. Many point satisfactorily settled at the meetin other matters (after ballot) were ta for forwarding to the Institution wit quest for a ruling. The points in dis are as follows :—

Excavation. Level of first "stage."
Damp-proof courses, 4½ in. wide.
Rough cuttings in brickwork.
Width for reveals in brick walls.
Mortar for stonemason and ter work.
Tracery measurements.
Preliminary measurements to ston somes and mullions.
Breeze slab partition measurements
Flues.
Winders and risers in timber stairc
Concrete block construction.
Fixed lights and opening lights.
Openings in double-faced 9 in. wal
P.C. sums and profit.

The advisability of publishing an i of the Standard Method of Measure the form of a pocket-book.

It is hoped that the questions and s may be published at a later date. I sary, another discussion will be he Surrey quantity surveyors, including tioners and students, are invited further inquiries to the Hon. Sec. Quantity Surveyors), Mr. Henry A. Mi F.S.I., "Glenlynn," Beulah-road Thornton Heath, Surrey.

THE BUILDING TRADE

NTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—V.

he former articles we have noted in connection with the length of es and how they are to be determined e position created where tenants hold ter the expiration of the term, but re two other subjects connected with es which have caused considerable liti- first, options to purchase or renew, ondly, the right to assign, and we now to refer to these.

to Purchase or to Apply for Renewal.

e are two kinds of options sometimes d in tenancy agreements and leases : option to purchase the property, and option to renew the lease. Where s an option to purchase there are points to be borne in mind. Will it against the rule against perpetuities? be exercised by assignees? Our space permit us to deal with these ques- oroughly, but a reference to some of e modern cases will serve to illustrate ts to be observed.

e there is an option in a lease to pur- must not offend against the rule perpetuities. The case of Woodall or (1905, 2 Ch. 257; *The Builder*, 1905) illustrates this and also shows this account such an option to pur- annot be exercised by assignees of . In two leases granted respectively nd 1869 for 99 years, it was provided case the lessee, his heirs or assigns second lease the words were "execu- ministrators or assigns") should at during the term granted become de- purchasing the fee simple, an option n to purchase at a fixed sum per

aintiff in this action was an assignee eases, and in 1904 he had exercised n to purchase, but the defendants, e assignees from the lessor of the le, had declined to complete the pur- the ground that the options were s against them.

held by the Court below that this fended against the rule against per- which fixes a limit of time within ery executory limitation, not being tion subsequent to an estate tail, t, that is to say a life or lives in l 21 years afterwards. This decision med by the Court of Appeal on a hich led to the same result. It was to make such an option valid in s of heirs and assigns it must run land, and to effect this it must in the Statute 32, Henry 8, c. 34 we have referred to in the last ut to do this it must directly con- ffect the land; but the covenant or containing the option did not affect but related to something wholly out- relation of landlord and tenant, and efore outside the scope of the nd to hold that such a provision hin the Statute and ran with the ld have most undesirable results as nities.

rt with this case where this point decided, as a general proposition of bsequent cases will serve to explain n particular, and it is here to be that the Court of Appeal in the e pointed out that an option to is not a provision for the continu- he term like a covenant to renew s been held to run with the land, sidered anomalous by many persons n now could not be questioned; nor e a notice to determine a tenancy wer of re-entry, but something en- tirely outside the relation of landlord and tenant.

It must not be considered that the option in the above case was only held to offend against the rule of perpetuities because it was contained in a lease for so long a period as 99 years; even if an option is contained in a lease for three, five, or seven years, unless there is a time limit within which it must be exercised it offends against the rule of perpetuities.

The recent case Rider *v.* Ford (1923, 1 Ch. 541; *The Builder*, August 3, 1923) will explain this proposition. By correspondence it was arranged that the plaintiffs, who were builders, should erect a house for the defendant upon the following terms :—The house to be built upon a certain plot and to be taken by the defendant for three, five, or seven years at a rent of £147 per annum, the defendant to have the option of purchasing either the freehold for £2,900, or to obtain a lease for 97 years, at a ground rent of £20, for £2,400. The defendant went into possession of the premises under this agreement on March 25, 1908, and after the expiration of the full term of seven years remained in possession as a tenant from year to year. In May, 1922, the plaintiffs gave the defendant notice to give up possession on March 25, 1923, and the defendant then claimed to exercise one of the above options. The action was brought by the plaintiffs seeking a declaration that the defendant was not entitled to exercise any option.

The Court—a Court of first instance—held on the authority of Moss *v.* Barton (L.R. 1 Eq. 474) and Buckland *v.* Papillon (L.R. 2 Ch. 67) that an option exists so long as the relationship of landlord and tenant continues notwithstanding that the original term has run out, and that as regards the option to purchase the freehold it offended against the rule as to perpetuities. The defendant's counsel admitted that it would so offend unless it could be read as giving only an option to the defendant personally or to an assignee of the defendant but only exercisable during the defendant's life, but the Court held it could not be read as so limited in the agreement. The option to call for a lease to run from the expiration of the existing tenancy, however, was held not to offend against the rule of perpetuities and to be exercisable by the defendant, and the fact that the new lease might contain different terms from the original lease made no difference in this right to call for a renewal.

It is important to observe this distinction between an option to purchase and a provision for the continuance of a term such as a covenant to renew or an option to call for a lease which does not offend against the rule as to perpetuities. Moss *v.* Barton and Buckland *v.* Papillon were both cases where there was a right given to call for a lease, and although in Rider *v.* Ford the agreement mentioned "the option of purchasing a lease" the Court held this was an inaccuracy of language as the plaintiffs were freeholders and there was no leasehold interest of 97 years in existence, and it was really a right to call for a lease. The doctrine that an option to purchase contained in a lease for a few years may offend against the rule of perpetuities would be more easily understood if it might continue so long as the relationship of landlord and tenant exists, for a tenant may hold over for an indefinite period; but there are decisions, which we shall refer to in detail, which show that an option is not one of those provisions in a lease which apply where in the absence of express agreement a tenant merely holds over, for as was shown in Woodall *v.* Clifton, it is outside the relation of landlord and tenant.

Most options, however, contain a time limit within which they may be exercised and then they must be exercised within that time, and that is the only safe way to proceed, as the rule of perpetuities can be provided against.

In re Leeds and Batley Breweries and Bradbury's Lease (1920, 2 Ch. 546; *The Builder*, September 24, 1920), a case sometimes reported as Bradbury *v.* Grimble, in a lease for seven years an option was given to the tenant to purchase the unexpired portion of the leasehold reversion if he gave the lessors written notice "at any time six calendar months before the determination of this lease." The lease had been extended for a further period of 12 months, but then had expired in 1911, the tenant continuing as tenant from year to year. In 1919 the lessors contracted to sell the house to somebody else, and the tenant then claimed to exercise his option. It would have been sufficient for the decision of this case to have held that the time had expired within which the option must be exercised, viz., the expiration of the lease, but the Court held besides that the option was wholly outside the relationship of landlord and tenant, and therefore was not one of the terms or conditions of the original lease which applied to a tenant holding over as a tenant from year to year.

Similar questions arise where a lease has been extended. In Sherwood *v.* Tucker (1924, 2 Ch. 440; *The Builder*, June 27, 1924), premises were let by agreement in writing for a term of three years from December 25, 1914, and the agreement provided : "The said tenant shall have the right to purchase the said house during the three years hereby provided for the sum of £700." Before the expiration of the term it was agreed "that this lease be extended for three years expiring December 25, 1920," and before the extended period had expired a similar extension of the lease was made expiring December 25, 1923. In September, 1923, the tenant expressed the wish to exercise the option, but the landlord contended it had expired at the end of the original term. The Court of Appeal referred to the cases Woodall *v.* Clifton and *re* Leeds and Batley Brewery and Bradbury (*ubi sup*), and held that the words used in this extension related only to the relationship of landlord and tenant created by the demise and thus did not include the option which was collateral and independent of that relationship.

In such an agreement, however, words can be used which will carry all the terms contained in the original lease. Thus in Batchellor *v.* Murphy (1926, A.C. 63; *The Builder*, November 27, 1925) a lease for 10½ years had been granted to a lessee which contained an option of purchase to be exercised by the lessee, his administrators and assigns during the term by three calendar months' notice in writing. After the lease had run about three years the lessee desired to be released and it was agreed by the executor of the late lessor that the lease should be surrendered, a new lease being executed by other lessees for the unexpired term of eight years and six months, "On the same terms and conditions in all respects as the lease of October, 1913, with the exception of the rent."

The House of Lords held that the words used here referred not to the demise of the term but to the actual document, the lease, and all the terms and provisions it contained, including the option which it must be observed had a time limit, viz., the 10½ years of the lease.

We must conclude our observations upon options in the next article.

NEW BUILDINGS IN LONDON

Burlington Gardens.—ADDITIONS.—Plans have been submitted to the Westminster City Council by Mr. A. K. Dyson for alterations and additions to 3-5, Burlington Gardens, and in Old Burlington-street and Cork-street. These plans have been approved.

Deptford. — BATHS. — The Ministry of Health has sanctioned the erection of the Laurie-grove women's swimming-baths. The tenders are shortly to be invited for these baths. The plans have been prepared by the Borough Engineer of Deptford, for whom the work is to be carried out.

Deptford.—HOUSES.—Messrs. Harding & Marks, builders, 1, Ashby-road, S.E.1, are to erect houses on the north-west side of Upper Brockley-road.

Dollis Hill.—EXTENSIONS.—A scheme of extensions to the St. Andrew's Hospital, Dollis Hill-lane, N.W., have been approved by the Governors of the Hospital. Mr. T. H. D. Scott, of 11, Finsbury-square, E.C. 2, is the architect. No building contract has yet been let.

Ealing.—HOUSES.—Tenders are being invited by the Ealing Town Council for the erection of thirty-two and eighty flats on a site at Framfield-road, Hanwell. The plans have been prepared by Mr. W. R. Hicks, Borough Engineer.

Hendon.—CINEMA.—Plans have been completed by Mr. G. O. Scorer, F.R.I.B.A., of 46, Lincoln's Inn Fields, W.C. 2, for the erection of a new cinema at Hendon.

Kensington. — SHOPS. — The Metropolitan Railway are having shops and flats erected at Horton-street, Kensington. Mr. E. Stanley Iles, L.R.I.B.A., is the architect, and the Pitcher Construction Co., Ltd., are the builders. The tender price is £17,175.

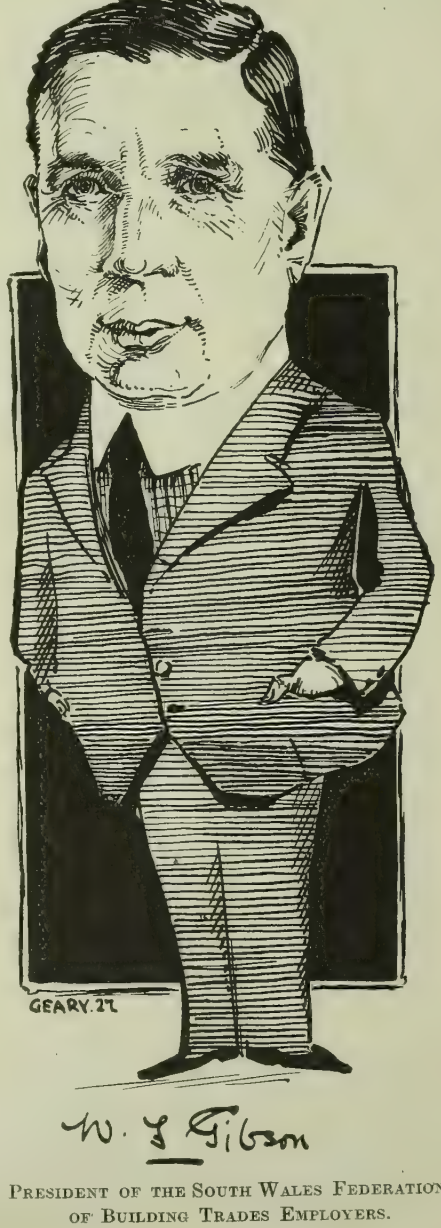
New Oxford-street. — PREMISES. — Messrs. James Carmichael, Ltd., builders, of Wandsworth, are to build new premises on the site of 61, New Oxford-street, W.C.1. The architects for this work are Messrs. Purchase & Welch, 3, Maddox-street, W.1.

St. Pancras.—PREMISES.—Messrs. Hoare & Co., Ltd., have obtained a site in Chalton-street for licensed premises. The Wenlock Brewery Co., Ltd., have also obtained a site for licensed premises in the same street.

Savile-row. — PREMISES. — Messrs. Greenham, Ltd., are carrying out the demolition work at 9 and 10, Savile-row, W.1, where new premises are to be erected to the designs of Mr. J. J. Joass, F.R.I.B.A., of 40, St. James's-place, S.W.1. Messrs. Rice & Son, of Stockwell, are the builders.

Shaftesbury-avenue. — BUILDING. — Demolition work is now going on at the Bloomsbury Church, Shaftesbury-avenue, near New Oxford-street, by Messrs. Greenham, Ltd. New buildings are to be built and Messrs. Hobden & Porri, architects and surveyors, 37a, Finsbury-square, E.C. 2, are preparing the plans. The building contract has been secured by Mr. Albert Monk, of Tottenham.

Stamford Hill. — CINEMA. — The London County Council has consented to the erection of buildings upon a site on the western side of Stamford Hill, Hackney, next to Amhurst Park. Mr. M. K. Matthews, Chartered Surveyor, has submitted the plans to the Council on behalf of the Provincial Cinematograph Theatres, Ltd.



Tower Hill.—PIER.—The Port of London Authority have decided to demolish the Old Swan Pier, London Bridge, and erect the new one on a site at the foot of Tower Hill.

Walworth-road.—REBUILDING.—An appeal for £50,000 has just been launched for the rebuilding of Browning Hall in Walworth-road, S.E.

Wandsworth.—STADIUM.—A new company has been formed, under the auspices of the South London Greyhound Racecourses, Ltd., for the erection of a greyhound racing track. The property comprises 10 acres of freehold land at Plough-lane, Summerstown, Wandsworth, S.W., which is to be utilised for the racing track. The plans of the stands and buildings, which have been prepared by Messrs. Elcock & Sutcliffe, FF.R.I.B.A., 21, Northumberland-avenue, W.C.2, in conjunction with Sir Owen Williams, provide for an all-weather accommodation for from 20,000 to 30,000 people.

The Building Trade: New Agreement for London.

A new working rule agreement, says the *Times*, has just come into operation for building trade operatives in the London district. It is claimed by the trade union side of the London Regional Joint Committee to be a definite advance on anything previously secured. Working hours all the year round are to be 44 a week, but provision is made for an extension during the period of summer time, and for a reduction in the winter months where no artificial light is available. The agreement sets out, in addition to the standard rates of wages, the rates for apprentices and learners. It provides that every employer, having proper facilities for training, shall be entitled to employ one apprentice to every five journeymen in any trade, provided that the proportion in the whole trade employed in the area shall not exceed one to seven. Clauses have also been inserted relating to extra wages for special classes of work.

PRESIDENT OF THE SOUTH WALES FEDERATION OF BUILDING TRADES EMPLOYERS.

INSTITUTION OF SANITARY ENGINEER

Annual Dinner.

THE annual dinner of this Institution held at the Holborn Restaurant on We day, November 2, when the chair was pied by the President, Dr. G. S. Col Among those present were Messrs. A. ford-Fawcett, H. T. Calvert, J. S. A A. P. I. Cotterell, H. G. Montgomery, Fidler, F. W. Bridges, A. J. Martin, Hammond, G. W. Chilvers, L. E. A. E. Sewell, E. Willis, Mrs. Clou Brereton, and the Secretary, Mr. Hasluck.

After the loyal toast had been hon Mr. J. S. Alford proposed the toast of Public Health Authorities," and Mr. Sandford-Fawcett, of the Ministry of H replied. Dr. Bostock Hill, who wa down to reply, was unavoidably abse

Mr. Arthur J. Martin, proposing th of "Kindred Institutions," said many think there were too many institution he thought there were not too man cerned with the vital subject of health justification of such institutions as the was the current death rate, which was thing like one-half what it was fifty ago. One of the institutions for whic had very kindly feelings was the Roya tary Institute. Many years ago they Institution of Sanitary Engineers ha gested a national Health Week. The Sanitary Institute had taken it up and now an Imperial Health Week, cel wherever the Union Jack flew. Othe tutions that were doing notable work i the Society of Medical Officers of the Institution of Civil Engineers, th tution of Water Engineers, the Insti Municipal and County Engineers, t Smoke Abatement Society, the Ass of Sanitary Inspectors, the Associa Cleansing Superintendents, and the of Engineers, the last-named havin them at least one president.

Mr. D. C. Fidler, President of the of Engineers, replied.

Mr. H. Greville Montgomery, Worshipful Company of Tylers and layers, proposing "The Institution tary Engineers," said it was because connected with the building industry ways than one that he came into to brickmakers, tilemakers, and the m sanitary pipes, things they would great profusion at Olympia if they e there. The sanitary engineer had to his virtues underground, and he harassed by the flow of bricks and t foreign parts into our shops. The sanitary pipe, whether of stoneware crete, was the finest pipe in the w

The President, in reply, surveyed tion of the Institution, and said th bers were still increasing, and mor than they were last year. Ther great increase in foreign membersh was a very healthy sign. They ha reached four figures, but if they as they were going they would do comparatively short time. There continued, a gratifying increase interest in sanitation in all its For the first time in forty years th of his University had had to classes, which were already ru duplicate. The speaker then refer valued services of the various ch committees, mentioning especia Chilvers, who, he said, was to president next year, and was o pillars of their society.

At the conclusion of his speech dent presented the Gold Medal of tution to Mr. A. P. I. Cotterell, w ledged the honour in a brief bu speech.

Mrs. Cloudesley Brereton pro final toast of "The Visitors," a Lapworth, President, Institution Engineers, replied.

PUBLIC WORKS EXHIBITION

The Congress and Exhibition of the Public Works, Roads and Transport will be held from Monday to Saturday, November 14-19, at the Royal Agricultural Hall, Islington, N. There is every indication that this year's exhibition and Congress will be more widely attended than ever, and the range of machinery and equipment that will be displayed will be of value to surveyors and engineers interested in public works contracting. Features of the Congress will be a number of papers to be presented for discussion, including the winning essays promoted by the P.W. Congress Committee for papers dealing with important phases of local government work. The principal subjects at this year's Congress are roads, sewerage and sewage disposal, concrete construction, water supply, house refuse and street cleansing, street lighting, public transport, coast erosion and smoke abatement.

The President of this year's Congress is the Right Hon. Neville Chamberlain, P.C., M.P., Minister of Health.

Following is a list of the exhibitors at the exhibition: the figures in brackets following each name is the number of the stand:—Abbott, Birks and Co., (227); Acme Flooring and Paving Co. (1904), Ltd., (145); Acme Patent Ladder Co., (194); Allan, Taylor and Co., (122); Allen, John and Sons (Oxford), Ltd., (33); Allen-Liversidge, Ltd., (136); Anglo-American Oil Co., Ltd., (5); Anglo-American Asphalte Co., Ltd., (159); Archer, Thos. and F., (88); Atlas Diesel Co., Ltd., (4); Atlas Stone Co., Ltd., (150); Aveling & Porter, Ltd., (84); Baird and Tetlock (London), Ltd., (32); Baker, T., and Sons, (5); Baldry, Yerburgh and Hutchinson (Roads), Ltd., (188); Barber and Colman, Ltd., (140); Barford and Perkins, Ltd., (85); Barnes, F. C., (142); Bell Bros. (Manchester), Ltd., (113); Bennett, Ben, Junr., Ltd., (187); Berry, Wiggins and Co., Ltd., (83); Blakemore, H. C., (75); Braham, Peterson and Benham, Ltd., (149); Bright Non-Skid Nail Co., Ltd., (199); Bristowes Marvin, Ltd., (73); British Neopost, Ltd., (1); British Reinforced Concrete Engineering Co., Ltd., (22); British Steel Piling Co., Ltd., (83); British Road Tar Association, (); British Taroleum Co., Ltd., (226); Broad and Co., Ltd., (210); Bromford Tube Co., Ltd., (97); Brookes, Ltd., (67); Broom & Wade, Ltd., (146); Brunner Mond and Co., Ltd., (20); Bryant and Langford Group (Quarries, (52); Buckland Sand and Silica Co., Ltd., (123); Byrd, A. A., and Co., (); Cambridge Instrument Co., Ltd., (); Carbic, Ltd., (42); Cawood, G. E., & Co., Ltd., (27); Celotex Co. of Gt. Britain, Ltd., (166); Cement Marketing Co., Ltd., (82); Changeable Sign Co., Ltd., (234); Chesseside Motor Co., Ltd., (117); Chittenden & Simmons, Ltd., (131); Clare, R. S., and Co., Ltd., (61); Climax Rock Drill and Engineering Works, Ltd., (196); Colbit Roadway, Ltd., (12); Colas Products, Ltd., (); Cole, M. R., (156); Coleman, Thos., & Sons, Ltd., (38); Concrete Equipment, Ltd., (126); Consolidated Pneumatic Tool Co., Ltd., (151); Constable, Hart and Co., Ltd., (107); Cooke, Troughton and Simms, Ltd., (54); Corrie, J. B., and Co., Ltd., (19); Cost Granite, Brick and Concrete Co., Ltd., (); Crow, Catchpole and Co., Ltd., (58); Deutmann Asphalt Co. (Gt. Britain), Ltd., (); Denholm Contractors' Machinery Co., (8); Downing, H., and Sons, Ltd., (102); Durable Roads, Ltd., (66); Electrolux, Ltd., (); Electricars, Ltd., (4); Enderby and Abbey Stanton Granite Co., Ltd., (90); Expanded Metal Co., Ltd., (72); Farrer, Wm. & Co., Ltd., (19); Field and Mackay, Ltd., (); Firmosec, Ltd., (103); Fodens, Ltd., (); Fowler, John, and Co. (Leeds), Ltd., (); Fox, Stockell and Co., (132); Francois Presentation, Ltd., (3); Fry Bros., Ltd., (); Gas Accumulator Co. (United Kingdom), Ltd., (195); Girling's Ferro Concrete Co., Ltd., (114); Glossop, W. and J., Ltd., (); Guest and Chrimes, Ltd., (140); Goodbarsby and Co., Ltd., (39); Hadfields, Ltd., (24); Hartley, Sons and Co., (13); Haskins, Ltd., (288); Hayward Company, (191); Highway Materials, Ltd., (154); Highways Colloidal, Ltd., (167); Highways Construction, Ltd., (74); Hill, Richard and Co., Ltd., (91); Hill-Jones, Thos., Ltd., (11); Holman Bros., Ltd., (53); Hopton-Wood Stone Firms, Ltd., (196); Horstmann Gear Co., Ltd., (110); Hydraulic Engineering Co., Ltd., (129); Hub Ironworks Co., Ltd., (200); Hubberd, F. C., and Co., Ltd., (34); Imperial Chemical Industries, Ltd., (20); Improved Wood Pavement Co., Ltd., (59); Ingersoll-Rand Co., Ltd., Ltd., (64); International Colfix, Ltd. (175); Jackson Electric Stove Co., Ltd., (185); Johnson, B., and Son, (28); Johnson's Reinforced Concrete Engineering Co., Ltd., (141); Johnston Bros., (101 and 44); Jones, Wm., Ltd., (17); Kent, George, Ltd., (161); Kleine Patent Fire Resisting Flooring Compound Syndicate, Ltd., (143); Knowles, John and Co. "Heating and Ventilating."

This is the title of a booklet (Catalogue 1123) issued by the Sturtevant Engineering Co., Ltd., of 147, Queen Victoria-street, E.C.4, the pioneers of the Plenum system of heating and ventilation. The publication deals chiefly with the Sturtevant combined Plenum system of heating and ventilation, but we understand that variations of this can be put forward in order to meet the special requirements of individual buildings. It is appreciated that, particularly in public buildings, the combination of heating and ventilating in one plant is not always the best arrangement; but we learn that this does not mean that the Plenum system as such is necessarily abandoned, as a modification may be adopted in such cases with beneficial results. One of the latest London buildings to have this installation is the Midland Bank's new head office, the work of Sir Edwin Lutyens, R.A., and Messrs. Gotch and Saunders, illustrated in our issue for October 7.

The Public Works Exhibition, Islington.

Among the exhibitors here are Messrs. Winget (1924), Ltd., who are taking the opportunity afforded by the exhibition to give a special display of their plant, in order to mark the 21st year since their inception. The "Winget" series of Open-Drum Mixers now range from the 14/10 model with the batch-a-minute record—complete with automatic water tank and swivel wheels—down to the handy engine-driven 5/3½ model, which is now supplied with or without elevating hopper. A full range is exhibited. Besides this very full range of mixers, Messrs. Winget are exhibiting several types of their concrete block- and slab-making machine, including the No. 2A Pressure Machine, the well-known hand-power press which has been used in housing schemes in all parts of the country for building on the Continuous Cavity System. Finally, there may be seen one of the "Winget" engine-driven crushers, complete with screen, a completely portable, powerful plant equally effective whether dealing with granite, whinstone, brick, or any other aggregate.

New Sanitary-Ware Showrooms.

Lord Astor, on Wednesday, November 2, opened the new showrooms for sanitary- and bath-ware of the Leeds Fireclay Company, Ltd., at 2, Cavendish-place. The house is the work of the Adam brothers, and the shop-front and interior have been reconstructed by Messrs. Yates, Cook & Darbyshire to be as much in harmony with the building as is possible. The exterior is very simple and unostentatious, and is carried out in the firm's own "Burmantoft's" terra-cotta. The ground floor is given over to the display of baths constructed out of fireclay, and bathroom fittings. These are well displayed and gain in effect from the effective colour-scheme of the walls, ceiling, and floor. The front room of the first floor contains a genuine Adam ceiling. The walls of this room have been decorated in a harmonising buff colour, and the room is given over to the display of several of the Leeds Fireclay's Company's fireplaces and overmantels in fireclay, which are designed in several pieces, and suggest, when assembled, an architectural feeling. In the basement are many styles of sanitary equipment, lavatory-pans and fittings, washhand-stands, babies' baths—including a replica of the fitting supplied to a leading London hospital—children's baths, etc. All these appliances are in working order, and there are many new and ingenious "gadgets" on view, such as an arrangement by which the "waste" from a washhand-stand may be emptied by means of pressing a lever with the knee. Messrs. F. G. Minter, Ltd., were the contractors for the alterations for these showrooms.

NEW BUILDINGS IN SCOTLAND

Ayr.—Additions.—Mr. Chas. J. McNair, of 112, Bath-street, Glasgow, has prepared plans for additions and alterations to the Picture Theatre, Ayr, for the Ayrshire Cinematograph Theatres, Ltd.

Dundee.—Buildings.—The following plans and sections of proposed new buildings, etc., have been lodged at the Office of the City Engineer:—Arklay-street—houses for Town Council; Old Cragie-road—bungalows for Mr. N. T. Stewart; and School-road—houses for the Northern Housing Association, Ltd.

Dundee.—House.—The question of converting the janitor's present house at the Dundee High School into additional classrooms has been discussed at the annual meeting of the directors. The proposed alterations and a new house for the janitor are to be built in the north-east corner of the school playground, at a cost of £1,950.

Glasgow.—Cinema.—Tenders are about to be accepted for the New Palace Cinema. The architect is Mr. Charles Mitchell, 2, Randolph-crescent, Edinburgh.

Glasgow. — Reconstruction. — The reconstruction of the Lorne Cinema House, Paisley-road, by Caledon Pictures, Ltd., 225, St. Vincent-street, is to commence shortly. The architects are Messrs. Gardiner & Glen, 164, Bath-street.

Glasgow.—Track.—The Albion Greyhounds (Glasgow), Ltd., have acquired ground at Ibrox, beside the Rangers' football field, where they are to construct an up-to-date racing track

Port-Glasgow.—Improvement.—The Town Council has fixed contracts for the second section of the improvement scheme known as the central area. The scheme consists of the erection of 28 houses of three apartments, four of two apartments, and six shops, the cost being over £15,468.

Torry. — Hall. — Tenders amounting to £2,230 have been accepted for the erection of a new assembly hall in Victoria-road, for the Christian Brethren. Plans have been prepared by Mr. J. A. O. Allan, F.R.I.B.A., 25, Union-terrace, Aberdeen.

THE SCOTTISH BUILDER

EDINBURGH ARCHITECTURAL ASSOCIATION

At a meeting of the Associate Section of this Association, Mr. H. Hubbard, A.R.I.B.A., in the chair, Mr. J. P. Walters, B.Sc.Tech., S.I.Mech.E., gave a lecture on "Electric Lift Equipment." He showed, with lantern slides, the various types of lifts in use at the present time, including some unusual specimens of lift engineering:—*e.g.*, the organ console lift installed in the Plaza Cinema Theatre in London, where during the musical interlude the organ console is raised from the orchestra up to the stage level. All the component parts of a lift were illustrated, and the principal functions of each described. The lecturer mentioned that the speeds for passenger lifts in this country range from 150 feet to a maximum of about 450 feet per minute, the most usual being 200 or 250 feet per minute; while in America the speeds, necessitated by the great height of the buildings, range up to 600 and 700 feet per minute.

CLYDE VALLEY TOWN PLANNING

"Town Planning" was the subject of an address delivered recently by Mr. George D. Macniven, F.R.I.B.A., principal architect to the Scottish Board of Health, to the members of Glasgow Institute of Architects and Glasgow Civic Society. Professor Thomas H. Bryce, M.D., F.R.S., presided in the absence of Sir John Stirling Maxwell, Bart.

The lecturer referred to the slow progress that was being made with town planning in Scotland. Apart altogether from the fact that by the Act of 1925 there was a statutory obligation on burghs having a population of over 20,000 to prepare town-planning schemes, and submit them to the Board of Health by January, 1929, there were other reasons why consideration of the subject should be no longer delayed.

Dealing with the situation in the Glasgow district, he pointed out that there were in Scotland 22 burghs to which the statutory obligation to prepare town-planning schemes applied, and of these exactly one half were situated within a radius a little more than twelve miles from the centre of Glasgow—what might be broadly described as the Clyde Valley area. Within that area there was a population of 2,000,000 people. It was obvious, the speaker submitted, that co-operation between various authorities in the area was essential, and he suggested that that might be achieved by each of the local authorities preparing its own scheme in close collaboration with neighbours, and, further, by all the local authorities within the area uniting in the formation of a joint committee, whose duty would be to prepare a plan for the development of the whole area in so far as that development affected the interests of all the local authorities in the area. The speaker strongly supported the preparation of a regional plan. The industrial wealth and potentialities for development in the Clyde valley were enormous. Some plan of the whole area embodying a unified conception of future development should be considered now, and considered from the widest possible angle. In conclusion, the speaker appealed to architects to take an interest in the project of a regional scheme for the Clyde valley, as it would be of incalculable benefit to the area, and would also have an immense influence in stimulating similar action in other parts of the country, and so further the cause of town planning in Scotland.

Lake District Planning.

Mr. Robert H. Mattocks, of Leeds, has been appointed regional surveyor of the Lake District South Regional Planning Committee. Mr. Mattocks, addressing the meeting, said the district was a national possession and one in which there was large scope for preserving natural beauty.

BUILDING TRADE WAGES IN SCOTLAND.

The following are the present rates of wages in the building trade in the principal towns Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for erro that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers—Masons', Bricklayers', Plasterers'.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXIII. No. 4424

NOVEMBER 18, 1927.

MANCHESTER TECHNICAL COLLEGE COMPETITION

our last issue a correspondent suggested that in view of the fate that has befallen other large competitions promoted by the Manchester Corporation, it would be "fairer to the architectural profession if some pronouncement were made as to the likelihood" of the ne for the Manchester Technical College, particulars of petition for which have just been issued, being carried out. e circumstances it is not surprising that such a question d be asked, not only by our correspondent, we may add, y other architects who know something of the Manchester l in architectural competitions. Whether justified or he city is rapidly creating a very unsatisfactory impresin architectural circles, and we believe a very strong g exists that the profession is not receiving proper treat-

Three important competitions have now been held period of years, the last, for the Town Hall and Library sion, being assessed only a few weeks ago, and, as we know, ıber of architects devoted a great deal of time and money preparation of designs for the scheme, in response to the tion of the Manchester Corporation. None of the buildwhich was the subject of these competitions has been eded with, and we have heard that a burning question e recent municipal election in Manchester had a distinct g on the latest competition. As an indication of the g which exists, we may quote the following remarks by chester correspondent who presumably knows the facts: whole performance is too serious to be amusing, even if rticular political party that has made accusations that own Hall extension scheme is extravagant has over- the trifling fact that as a party it was responsible for heme. It is becoming far too easy a way out of a difficulty mit as an excuse in these days that a code of honour, at should be regarded as settled convictions, can be n overboard by saying that it is a pity to mix party s with local government. It is nothing less than instability nuddle-headedness from beginning to end. Has the ectural profession a right to think that it is being igged? The time to worry about extravagance was when rliamentary Bill was passed some years ago. Apparently inking is done afterwards. Meantime, the Corporation urchased most of the land and buildings in what is lly supposed to be the finest position in Manchester. t immediately after the architect's prize-winning design lished, we find a vote-catching plea to the citizens to extravagance. It is a sorry tale. The old saying that Manchester thinks to-day, the world will think row,' threatens to become a libel; it clearly does not ts own mind."

our part we know it is getting to be quite a common e for public bodies to promote and hold competitions g large "fields" of competitors, when there is very ossibility of the scheme ultimately being proceeded with. is tendency is growing can be seen if one reviews the of post-war competitions that have not gone forward building stage. One can understand that economic ons of the present day demand very careful considera- any large project; but it would be fairer to architects as ssion and more conducive to better effort and better anding if no competition was promoted unless there easonable chance of its ultimately being proceeded with.

hink we can say that the endeavour of every competing t is, by winning a competition, to have the opportunity to erect the building; he is not striving merely to secure a money prize for a set of drawings. This fact is fairly evident when one considers that a premium rarely covers the outlay of the competing architect who is lucky enough to receive it.

It is true, of course, that the promoters of most competitions fine themselves a certain sum in the event of their not proceeding with the scheme, which sum goes to the successful competitor, and in the conditions of competition in both the Manchester Town Hall extension and the Municipal College of Technology extension there is a clause binding the promoters to pay substantial sums to the successful competitor if the work is not proceeded with within two years; but while this may be regarded as some alleviation of the disappointment which a successful competitor must feel in the non-fulfilment of his ambition, it must be remembered that any architect worthy of the name who submits a design which is found suitable for acceptance has a legitimate grievance if the promoters do not proceed with the work, even though they agree to pay a considerable sum of money if they do not. Such payment is poor satisfaction to a winner, and none at all to the scores of unsuccessful competitors, whose work in the aggregate can be conservatively valued at many thousands of pounds. The total effort put forth and the expense incurred by the competitors in a large competition is immense. However varying their solutions may be, each gives freely of his best, and in return they should be able to feel that there is a fighting chance for the winner to reap his due reward.

It would appear that the only solution to this trouble is for promoters of competitions to have a better understanding and appreciation of what they receive, and one must hope that this will happen when the general public get a fuller appreciation of architecture and architects.

We believe there will be considerable agreement in the profession that the inquiry which we printed in our last issue is a reasonable one, and that it would inspire confidence if those architects who intend to compete could have some definite assurance that the promoters intend to proceed with the work of extending the College of Technology from the design accepted by the assessors. We have no doubt in the *bona fides* of the Corporation, who are the promoters, and the fact that they have issued full details of the competition and have appointed three well-known architects as assessors would, in ordinary circumstances, be a reasonable guarantee that the work would be proceeded with following acceptance of a design; but the outcome of the Art Gallery competition and, again, the very recent Town Hall extension competition, is not likely to be forgotten by the profession, and we believe there are architects who will regard the risk of another disappointment as too great to be faced. The matter is of importance to architects as well as to the Manchester Corporation, for while the profession looks for some assurance that the winner in this Technical College competition will receive the full reward of his success, so the Corporation must hope to obtain the best scheme for the extension the profession can produce, and this they are more likely to obtain if they remove any cause for disinclination to compete which may exist in the minds of some of our leading architects. The latter would appear to be one for the Royal Institute of British Architects, who have done so much to improve the system of architectural competitions, and who, through the assessors they nominated, could obtain an intimation that the Corporation really intend to carry out the work.

NOTES

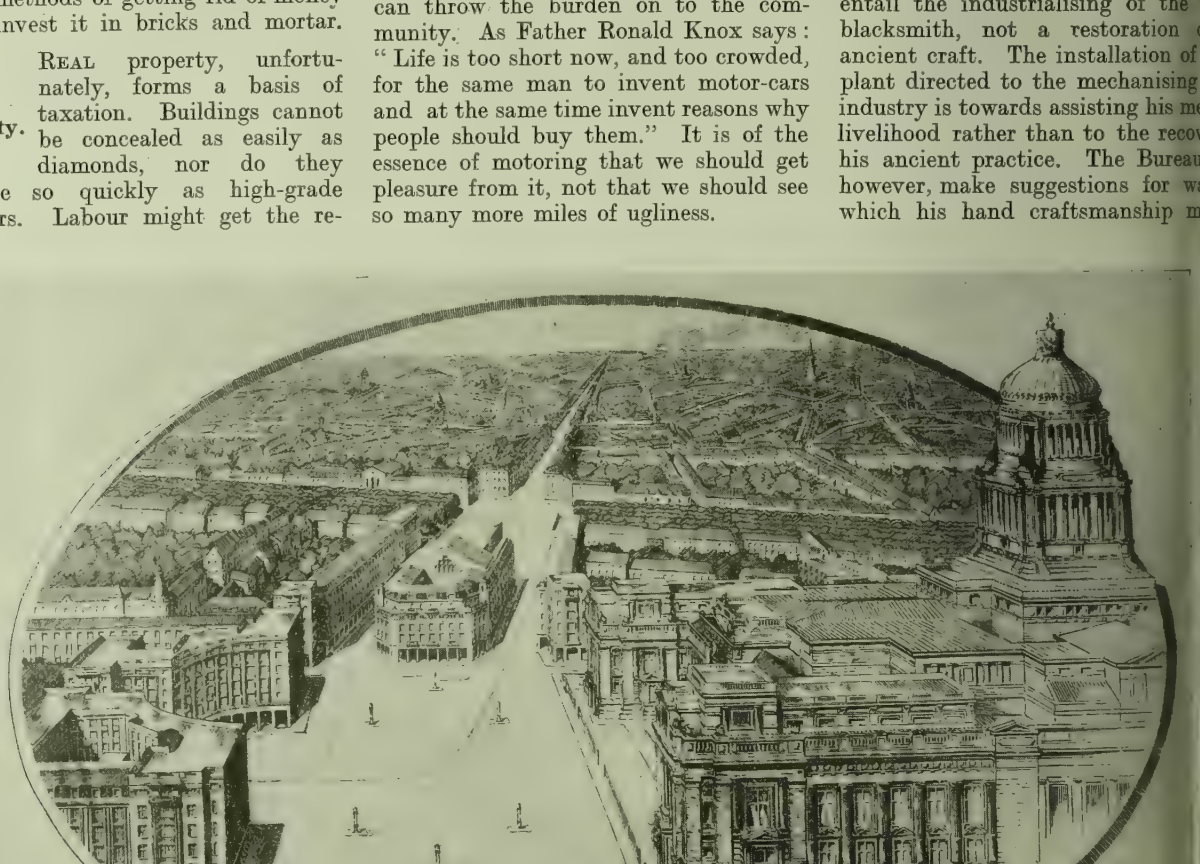
Architecture and the Surtax.

A CORRESPONDENT writes to ask whether it is possible to visualise the effect of the Labour Party's proposals upon the future of architecture. He, quite rightly, concludes that we prefer to avoid discussions upon party politics. There is no need for us to enter into a lengthy discussion upon the economic consequences of the proposed surtax upon unearned incomes above £500. As a single issue it is possible to trace the consequences logically. The psychological effect of the surtax upon the instinct of a race in its efforts to exercise self-denial, and to save money, is undoubtedly a factor that is disturbing. We believe our correspondent to be correct when he says that many people will find means of transferring the greater portion of their money abroad, even if this means living abroad. But the points that concern us in architecture are (1) that a man would be less able to save; (2) that building represents one method of spending money. We are afraid, however, that in the desire to spend rather than pay tribute, there are easier and more popular methods of getting rid of money than to invest it in bricks and mortar.

Real Property.

REAL property, unfortunately, forms a basis of taxation. Buildings cannot be concealed as easily as diamonds, nor do they depreciate so quickly as high-grade motor-cars. Labour might get the rebound from the initial effects of liquidation through spending, and one could safely prophesy that the motor industry for a time would easily lead the building industry. (Incidentally this would be a nice problem for Labour to adjust with Coventry.) When the surtax does arrive it will be safe to assume, as a corollary, that what we NEED will be provided for us. If we must spend, therefore, we shall take care that we spend it on the things we want, and the greater the luxury the more shall we want it. We will not pause to think that if we are all spending someone will end up eventually with the bulk of our money ripe for the tax-gatherer. But with our new philosophy we shall have enjoyed the spending, and we shall cease to care about the troubles of the man who has accumulated our money.

Amenities.

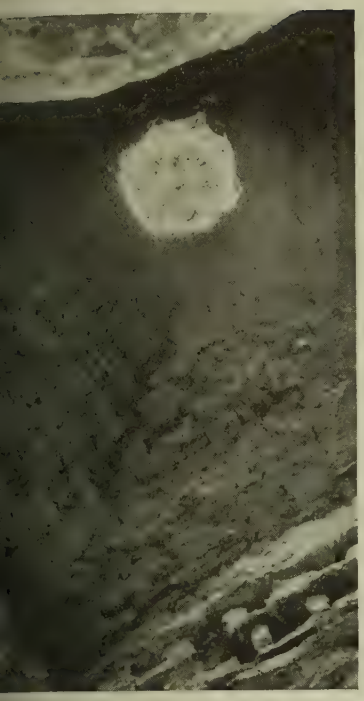


SOME months ago we published an article by Mr. John Angus dealing with the responsibility upon motor-car manufacturers to preserve the amenities of the countryside. If it is not an absolute business necessity at the moment for the motor industry to take action in their own interests, it is merely a question of time—unless they can throw the burden on to the community. As Father Ronald Knox says: "Life is too short now, and too crowded, for the same man to invent motor-cars and at the same time invent reasons why people should buy them." It is of the essence of motoring that we should get pleasure from it, not that we should see so many more miles of ugliness.

The Commercial Mind.

MUCH credit is admit due to Mr. Morris developing an enormou dustry, but it remains him to break the trad that the penalty of industrial prosp is ugliness. It may be that a busy thinks he cannot afford time to co appearances, but even from the p business point of view the preserv of England will become so impo eventually that the technical diffe between a six-cylinder and a cylinder engine will seem trivial.

The Village Blacksmith.



WE can heartily sympa with the aim to assis village blacksmith, on primary a local w and so long connected village life. The Rural Industries Bu whose leaflet on this subject we received, should find support fro nation in their endeavours to him and find new directions fo work. The pamphlet points out various ways through which this f industry can be resuscitated—we d say recovered, because the prop made and the methods to be ad entail the industrialising of the v blacksmith, not a restoration o ancient craft. The installation of p plant directed to the mechanising industry is towards assisting his mea livelihood rather than to the recov his ancient practice. The Bureau however, make suggestions for wa which his hand craftsmanship ma

ed, assisted by such labour-saving ods as may help to this result. We however, that the causes operating troy, or else divert his industry, and underlie the need for assistance, also to be taken into account. The trialising of the village blacksmith appear to some of us as only the mation of that loss to village com- l life which we regret.

riory eon- ote.

A VERY interesting example of domical roof-construction is to be seen in the pigeon house at Penmon Priory, Anglesey. This column is square on plan, a somewhat al shape. The walls, up to a lerable height, are honeycombed hundreds of nesting boxes. Above oint the stones of which the building nstructed are gradually corbelled in an ingenious manner, retaining n at each angle, and finally forming are dome with a circular lantern top. Above this hole is erected a cupola, consisting of a little circular of overlapping courses of stone, rted on six short columns, pro- ventilation and a means of access e birds. In the centre of the ng is a massive stone structure, pling a tree-trunk with wide, flat branching from it as steps, and ply intended to support a ladder eaching any desired pigeon-hole. exterior of the building can be appreciated now that ivy has removed, revealing more com- its simple, but well-proportioned The slight stress on the line between and roof marks the beginning, he cupola the termination of a g piece of stone roof design.

Building Costs.

A CORRESPONDENT writes : "It is confidently expected that during this winter there will be a still further reduction of building costs, following the reduction of the subsidy. I think, however, that some attention might be given to the methods by which building in France is so much cheaper than in this country. I understand that recent figures show that with the exception of plumbing, building prices for all other branches of the industry are about half of those in England. There are various reasons for this. Wages in comparison with ours are lower ; for example, the daily earnings of carpenters, joiners, plumbers and masons are about 40 francs ; but piecework is becoming more and more general in the building industry in France, and according to official figures provided by the Department of Overseas Trade, many workers, when engaged on piecework, may earn more by 50 to 70 per cent. than the basic daily wage of men on Trade Union rates. One custom in the building industry in France, however, has not yet been tried in this country. When it is necessary to accelerate the speed of work, a regular supply of whitewine is provided free of charge, and I hear of one job in Paris where, as a result, work proceeds very merrily towards the evening!"

An Insanitary Practice.

A CORRESPONDENT informs us of an insanitary practice that is being adopted in several instances known to him, where houses have been divided into maisonettes. In a typical case there is a kitchen with a scullery leading therefrom and a doorway from the scullery into a watercloset. The incoming tenant causes a gas-cooker to be fixed in the scullery, which he converts into a kitchen, using the original kitchen as a dining room. This conversion, our correspondent reminds us, is in contraversion of No. 1 of by-laws under the Public Health (London) Act, 1891, which provides that a watercloset shall not be constructed so that it is approached directly from any room "used for the manufacture, preparation or storage of food for man." The remedy, he suggests, would be a by-law providing that any person intending to fix a gas-cooker in any room shall give notice of such intention to the sanitary authority.

Shopfronts.

AT the end of this month will be published the November-December number of *Architecture*, devoted to the shopfront. Illustrations with some elevations will be given of many of the latest and most interesting of London and provincial shop exteriors —including several that have never yet been put on record. With them in the issue is included Mr. Arthur J. Davis's admirable lecture on "Modern Shopfronts and their Treatment," read before the R.I.B.A. This number will contain also its usual architectural features, including a continuation of Mr. E. Maxwell Fry's interesting series "Axes and Vistas," in which he deals with Hardwick's Euston Station approach.

Pigeoncote at Penmon Priory.

GENERAL NEWS

Professional Announcement.

Mr. Gilbert H. Cotton, A.R.I.B.A., M.I.Struct.E., 78, Dean-street, W.1, has opened a branch office at 27, Market-place, Reading (telephone 1200). He will be pleased to receive trade catalogues at the latter address.

A New Church for Luton.

We learn that Sir Giles Gilbert Scott, R.A., is to be architect for the new St. Andrew's Church, Luton, to be erected at a cost of £15,000.

A Parliamentary Candidate.

We learn that Mr. Ben Gilmore, a member of the firm of John Gilmore & Co., plastering contractors, has decided to stand as Parliamentary candidate for a London seat at the forthcoming General Election.

A Proposed Pavilion, Bexhill.

The Minister of Health has, it is learnt, written to the Bexhill Council approving the proposal to purchase a pavilion and land on the sea front, but stating that he is not satisfied that the price (£44,500) is reasonable.

A Link with King John.

A relic of the old palace of King John, a stone pillar that formed part of a colonnade around the palace, and believed to be the last-known existing stone of the ancient building, has been erected in a conspicuous position at the side of the principal entrance to the Kingston Public Library and Museum.

Designs for League of Nations' Building, Geneva: Exhibition at R.I.B.A.

Designs submitted by British competitors for the League of Nations' new building at Geneva will be on exhibition in the R.I.B.A. Galleries from Friday, November 25, to Saturday, December 3, inclusive, between the hours of 10 a.m. and 8 p.m. (Saturdays, 5 p.m.)

London Squares.

In view of the sittings of the Royal Commission on London Squares which have recently commenced, we call attention to the booklet prepared by the London Society some little time ago on this subject. The publication can still be obtained price 1s. from the offices of the London Society, 27, Abingdon-street, Westminster, S.W.1.

Canterbury Cathedral: Restoration of Water Tower.

The first meeting of the council of the Friends of Canterbury Cathedral was held on November 8, at the Deanery, Canterbury. The council agreed to undertake as their first special piece of work the restoration of the water tower on the north side of the cathedral at an estimated cost of £1,000. The water tower is one of the gems of the cathedral, the lower portion being decorated Norman work and the upper work of the fifteenth century.

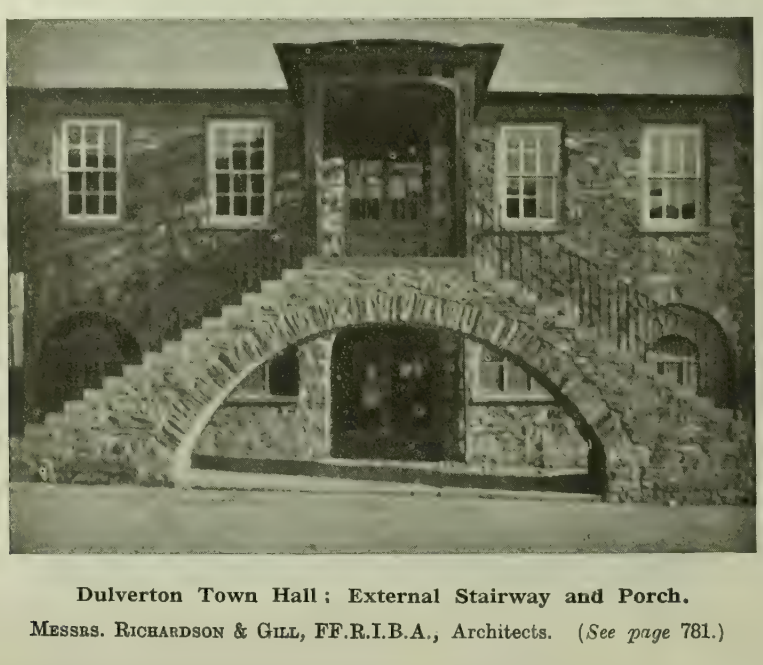
New Trent Bridge.

The new bridge which the Nottinghamshire County Council has constructed at a cost of £120,000 over the River Trent at Gunthorpe, was opened by the Prince of Wales recently. The bridge, together with two and-a-quarter miles of new approach roads, will provide a shorter and much improved route for traffic proceeding from London, Leicester, and the South to Doncaster and the North. It will also be the means of opening up a main arterial road through a district where important colliery developments are taking place.

Big Electricity Schemes.

The Electricity Commissioners have now given final approval to the scheme for the erection by the London Power Company, Limited, of a new generating station at Battersea. Preliminary designs which were submitted to the Commissioners are being subjected to careful revision, says the *Times*, and it is hoped that early in the coming year a start will be made with the construction of the station. The site secured has a frontage of about 800 ft. to the Surrey side of the river immediately below the Victoria Bridge of the Southern Railway, and is 15 acres in extent.

Housing and Town Planning Conference.



The National Housing and Town Planning Council announce that owing to the very large number of delegates appointed to attend the proposed Housing and Town Planning Conference at the Royal Station Hotel, York, it has not been found possible to obtain sufficient hotel accommodation for all the delegates in the city of York. It has accordingly been decided to transfer the Conference to the Crown Hotel, Harrogate, where the proceedings will be opened on Saturday, November 26, at 10 o'clock. The Conference will be attended by delegates from local authorities in England and Wales and Scotland, as well as by prominent housing reformers and town-planning experts. One of the principal subjects on the agenda will be the importance of continuing the national housing programme and the desirability of a fresh housing survey. Other subjects for discussion will include the necessity of speeding up slum clearance, the housing of agricultural and rural workers, regional planning, and the extension of the Town Planning Act to include the planning of built-up areas. A number of papers dealing with points of policy will be submitted to the Conference.

Palaces of Mediæval Italy.

Sir Banister Fletcher, F.S.A., F.R.I.B.A., lecturing on Wednesday at the Central School of Arts and Crafts on the secular architecture of mediæval Italy, pointed out that few civic buildings exist which date earlier than the twelfth century; for in the Middle Ages warfare aimed at the destruction of fortified and civic buildings, while regarding churches as sacred. The most interesting aspect of secular building activities of this period is the picture it gives of the rise and growth of municipalities and the development of the communal idea. Their conscious power was exercised not only in their dealings with irresponsible nobles and in the erection of great cathedrals, but also in all departments of civic life and in providing on a grand scale the various civic buildings necessary for carrying on and protecting the life of the towns. The great outstanding building of this period was the Doge's Palace, on the Grand Canal, Venice, which had great historical associations, and took our minds back to the time when Venice was a great republic, whose fleets swept the sea and protected her commerce, as the British Fleet protected our commerce to-day.

St. Peter's, Great Windmill-street, W.: Proposed Demolition.

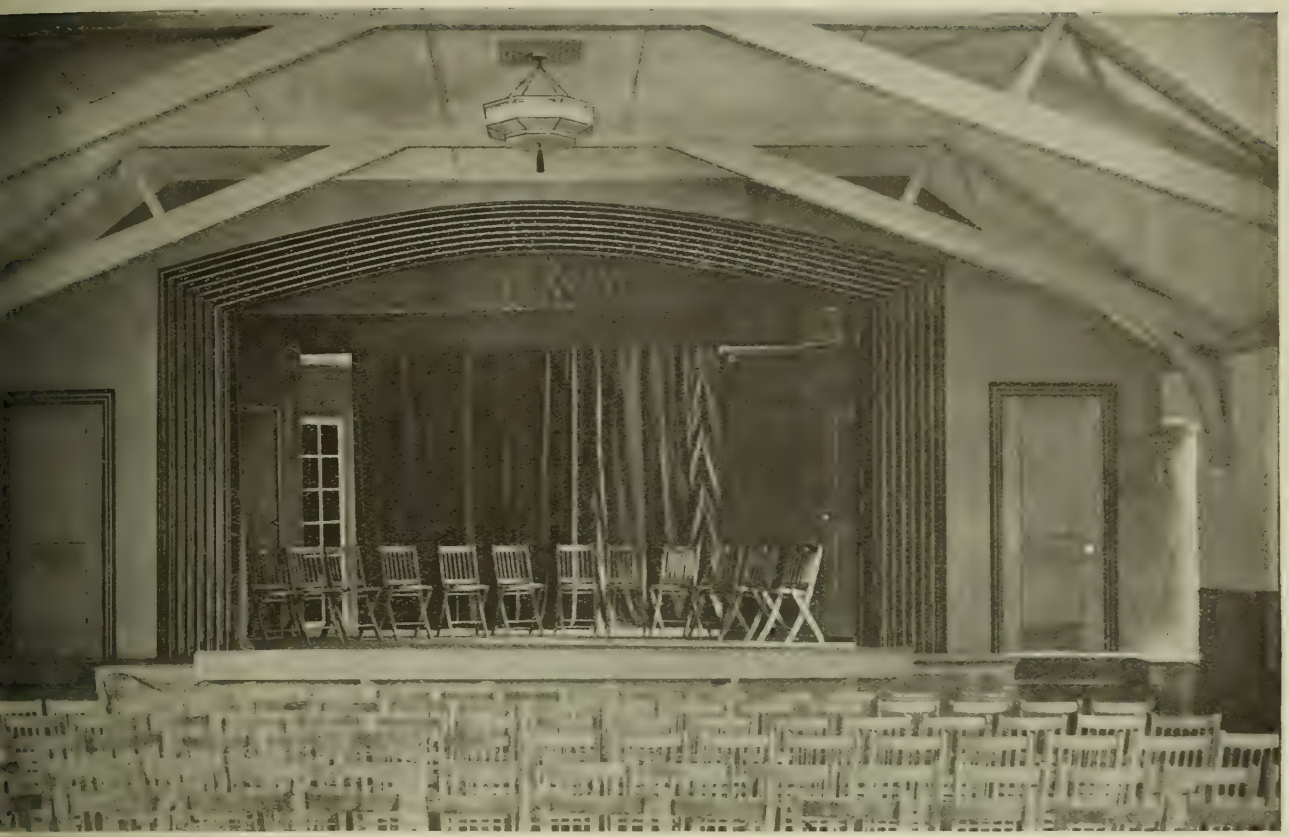
Canon Donaldson presided at a meeting at Church House, Westminster, on Tuesday last week, to protest against the proposed demolition of St. Peter's Church, Great Windmill-street. It was announced that a letter had been received from the Bishop of London stating that he was prepared to receive a small deputation on the matter.

Dulverton Town Hall; External Stairway and Porch.

Messrs. Richardson & Gill, FF.R.I.B.A., Architects. (*See page* 781.)

COMPETITION NEW

Franciscan Church, Limerick.



Architects are invited to submit plans for the completion of the Franciscan Church, Henry-street, Limerick, not later than December 8. The plans will be considered by the Provincial and Council of the Irish Franciscans, who reserve to themselves the exclusive right of selection. Plans should be forwarded to the Superior, Franciscan Convent, Henry-street, Limerick.

Improvement Scheme, Newport, Mon.

The Newport (Mon.) Council is considering a proposal to invite architects to submit competitive designs for an elevation of High-street (from Market-street to Griffin-street) and for (*a*) widening Market-street throughout to 30 ft., and widening Griffin-street throughout to 36 ft; (*b*) by altering the present market hall and buildings and widening Market-street and Griffin-street to the best commercial advantage, or by removing the market to another site. Premiums are to be offered, and the President of the R.I.B.A. will be asked to nominate the assessor.

Proposed New Senior Elementary School, Birkdale, Southport.

Southport Education Committee invites architects to submit designs in competition for a new senior elementary dual school for 320 pupils. The premiums (subject to the usual conditions) are as follows: First, £[illegible] to merge in the commission; second, £[illegible] and third, £50. Professor S. D. Adshead, M.A., F.R.I.B.A., is the assessor. Copies of the conditions of competition, together with plan of the site, may be obtained on application to the Director of Education, Municipal Buildings, Southport, at a charge of half a guinea, which will be returned to competitors on receipt of their designs. The designs must be in the hands of the Director of Education not later than March 1928.

Assembly Hall.

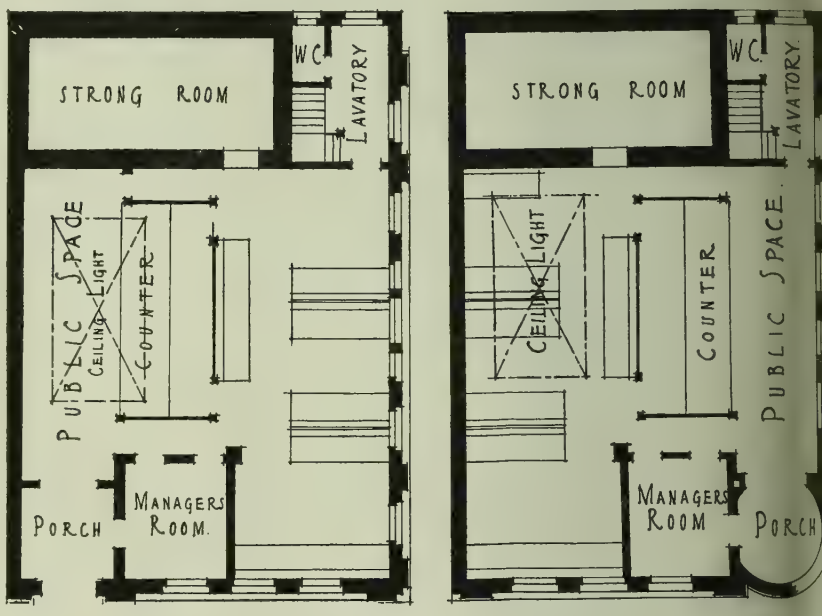
THE WINDOWLESS BANK

ITS ADVANTAGES, PROBLEMS AND FUTURE

By J. HEMBROW, A.R.I.B.A.

THERE are sound reasons for the contention that banks should have no outer windows. Quite a number have been built in this way, and since fitness and purpose always tell in design, it is not surprising to find that such banks impress one with their fitness and that those which are approximate to windowless banks also rest in the memory if their design be good. After all, it *is* foolish that an architect should be asked to put a steel-studded outer door four feet or so from a large plate-glass window.



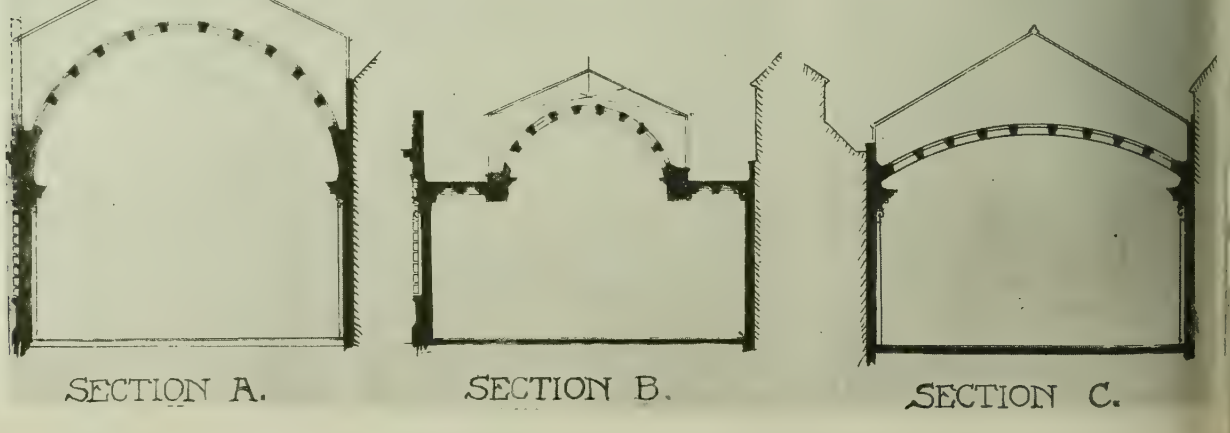
A bank building should convey certain impressions to the public. It should suggest security as a building and dependability as a concern. Solidity is required to accomplish this, and a windowless building must, perforce, unless the person who designed it is a genius of ineptitude, look more solid than one pierced with many windows. Properly handled, also, it gives the building that dignity and austerity of character which is associated in the public mind with the severe business of banking. It is also true that a building can hardly look its part to perfection without, in some measure, actually filling that part, and in this case quite a number of technical as well as functional advantages are found in the train of the elementary ones which appear at once.

In the planning of banks, that is the banks which come into the every-day practice of the architect, the architect is always faced with two types of plan which spring from two conflicting schools of thought. The managing director of A's bank will not allow his tellers to face windows. He believes that the person entering the bank should be in that position. There is much to be said for his contention, too. The teller should never be faced with a mere silhouette of the person before him, instead of an unembarrassed view given by the light falling on that person's face. Things happen sometimes in branch banks. This managing director, therefore, in dealing with a corner site prefers to place his entrance at the point in the main street farthest from the corner and allows the windows to light the clerks' portion. The public space then comes at the point farthest from the side windows, but facing them with perhaps additional light obtained from a ceiling light.

The managing director of B's bank, on the other hand, says things do not so often happen in banks as to make this point worth considering against the importance of the gain to business attracted by a corner entrance. He, therefore, has his public space on the window side, with the tellers facing them. Two type plans illustrating this difference will be found here. I call them the quarrelsome plans, because whichever one is suggested the other always rises up and gives battle.

Now, to have no windows at all and to light the banks entirely from the ceiling, ends that controversy at least. The principal entrance may now be placed anywhere desired: it will make no difference to the lighting, and in so far as the attainment of beauty and dignity is concerned the entrance is probably better in neither of the positions chosen by the gentlemen above. It will assist also in site selection. A corner site no longer becomes such a vital necessity that position in the town need be sacrificed to it as happens quite often now. As long as reasonable right of light angles exist the side light so eagerly sought is no longer indispensable. The quarrelsome plans can cease their quarrel. There are, therefore, fundamental advantages in the use of the windowless design, and as is often found one virtue implies others. It is easier, we have seen, to place the bank owing to the reduction of problems of light, and the design becomes easier to make because it falls readily into line with need.

It has been remarked that a greater impression of security is obtained in using a windowless scheme: and it is not only an impression of that virtue: the building *is* more secure. It is very easy to cut away a sheet of glass, it is not impossible to replace it after entry has been made, but it is very difficult to cut through a substantial stone wall. Nor can the burglar get in by means of the roof lighting if the system of pie coffers be adopted. The barrel or dome be of reinforced concrete, which is not p tical to cut through and, unless the s is large, not passable: or if on such a l scale as to allow the burglar to pass, t protection is cheaper than ordinary wind or in any case he has a perilous des by ropes or some similar tackle before with no avenue of escape if he is distur and at great disadvantage, too, in pas out what he steals. "Peeps" or "squi



The "Quarrelsome" Plans.

for police observation also are not dif to arrange and the burglar might we observed without anything to warn him he has been seen; in fact, few bur would tackle such a proposition.

There are some who say that "the no light like window light," a dogma it would be very difficult to justify. there is this: it is a disadvantage to working within a building not to be to look out of windows. One does not gest that bank staffs spend more tim looking out of windows than others, can one agree with the gentleman who he would have no windows for his staf would put them all in "blinkers" to them concentrate; anyone who has work any length of time, particularly if he pened to work alone, in a "blind" room have felt a sense of imprisonment. impression needs to be guarded again prevent the interior having a depre effect.

It is not so difficult as it seems. C mural treatment will reduce or cur After all, in quite a number of bank windows are few, perforce, and in s

ion that they have to be obscured—they frequently obscured in any case—in most s the only portions through which one glance are the topmost panes giving impse of sky or smoke. So that really e is probably only an impression to com-

rtainly roof light as a working light is to beat; its distribution is better than light. There can be an almost complete nce of shadow if wall tints are carefully idered to allow of light reflection. Mr. ncis Jones's beautiful bank at Southport n example of what can be accomplished his way, although it is not a windowless ding. Mr. Francis Jones has used a ed coffer dome and flats with pierced rs. A further example of such lighting Messrs. Thomas Worthington and Sons' ulty of Arts building at Manchester, re they have used a barrel with pierced rs, and in the same firm's design for new Masonic Temple in Manchester; these systems are highly suitable to k lighting.

the case of a bank, certain highly effi- t forms of roof lighting are denied us. cannot adopt the north light truss, for nce, although this is probably the best ting medium which has been designed o now; and we cannot use a roof like eenhouse or a conservatory because of earance and because they would expose but the Renaissance style, which has ys been the favourite medium of banks, es to our aid with its coffers, etc.

ne ideal section will have to evolve, but e are salient problems which are worth ntion. They are not, indeed, outstand- y difficult, but they are certainly in- ely interesting, nor do they need the ntest freakishness to surmount them. y call for very careful elevation treat- t. To make this a little clearer three ons are given which will serve as a basis discussion and demonstrate the difficulties ch arise.

ake section A on an island site or corner. nay be agreed that, within reason, the er to the semi-circular the barrel be- es the better will light be distributed; also obvious that the greater the area he ceiling that can be enlisted into lighting service the better the result; but the design is faced with a serious defect. The barrel or dome needs to have a glass roof above it, which is the "greenhouse" roof we eschewed inside the bank, and surmounting a good classic building it will look ridiculous. It will, in fact, be an eyesore, especially in practice on a corner site, or where the building lies in a hollow in the town. This we can get over by screen walls (dotted), but these will screen our barrel, and unless we have used it for design alone our semi-circular barrel has lost its efficiency.

A compromise can be made—this is shown in section B. This section will give

District Bank, Southport: Vestibule Door and Fireplace, Banking Hall.

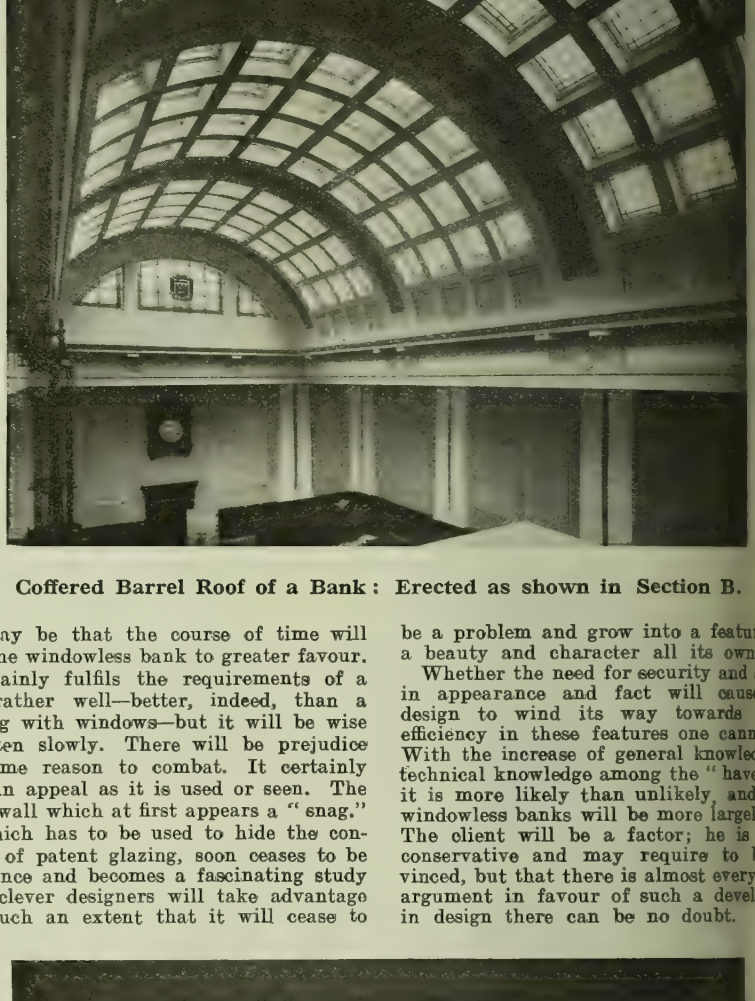
good light angles and allow for reasonable roof treatment. The screen walls in this case can be made high enough to obscure the glass roof without interfering with the light or becoming ugly in themselves.

If it is not a corner site—i.e., if it is naturally screened at each side by its neighbours, section C will probably be suitable; in this case it will be, in all probability, better than section A used in the same position, for A deals with side light, and C lays itself out more to obtain direct sky light, taking advantage of such light angles as the site allows. It also allows the whole of the ceiling to be used, because no screen walls have to be considered.

If the building is a square or approaching it, a dome can be effectively used. In this case the outer dome might be treated in such a way that it could be exposed and the screen walls dispensed with if the clients would go to the expense of circular on circular glass work, but it would need care.



Our younger or less experienced readers may ask why one should complicate the

A Windowless Bank at Preston.

design by plating a "glass house" roof outside the barrel or dome; why, for instance, we could not be satisfied with a delicate design in steel with suitable refined tints of glazing? Certainly, if we could make our barrel itself the roof, the problem would be simplified, but there is a serious disadvantage. It will be found, if the reader observes carefully different kinds of roof lighting, that where single glazing of this kind has been used serious down draughts prevail. The writer has been called in on several occasions to deal with old ceiling lights of this kind: their cure is difficult and expensive. The remedy which first occurs of placing heating pipes round the edge, as is done with a clerestory in a church, is not very effective, because the middle portion of the light is away from them and the chilled air drops right through the heated area. It generally calls for an elaborate system of double glazing, which brings in its train difficulties in cleaning, etc., and other troubles.

The single glazed ceiling light in the form we wish it, is also extremely difficult to keep water-tight. To overcome these difficulties we use a double roof. The inner dome or barrel ceiling is protected by an outer glass roof and the space between is heated so that there is a cushion of warm air between the cold outer air and the room, and down draughts are eliminated; cleaning and repairs are also facilitated by this means. Also with the old unprotected glass light a flying slate or stone has sent more than one ugly spear of flying glass whizzing down into the chamber with danger to those below; the outer roof is a protection against this, as it can be of wired glass.

Coffered Barrel Roof of a Bank: Erected as shown in Section B.

It may be that the course of time will bring the windowless bank to greater favour. It certainly fulfils the requirements of a bank rather well—better, indeed, than a building with windows—but it will be wise to hasten slowly. There will be prejudice and some reason to combat. It certainly grows in appeal as it is used or seen. The screen wall which at first appears a "snag." and which has to be used to hide the conditions of patent glazing, soon ceases to be a nuisance and becomes a fascinating study which clever designers will take advantage of to such an extent that it will cease to be a problem and grow into a feature a beauty and character all its own.

Whether the need for security and sol in appearance and fact will cause design to wind its way towards gr efficiency in these features one cannot With the increase of general knowledge technical knowledge among the "have n it is more likely than unlikely, and, windowless banks will be more largely The client will be a factor; he is al conservative and may require to be vinced, but that there is almost every l argument in favour of such a develop in design there can be no doubt.

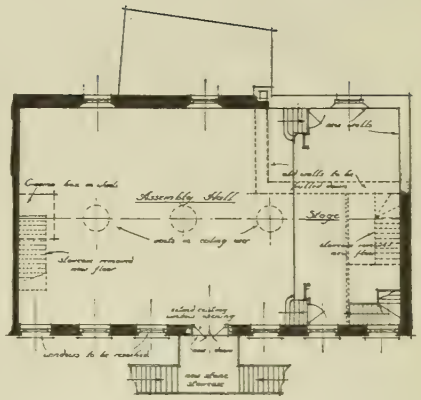
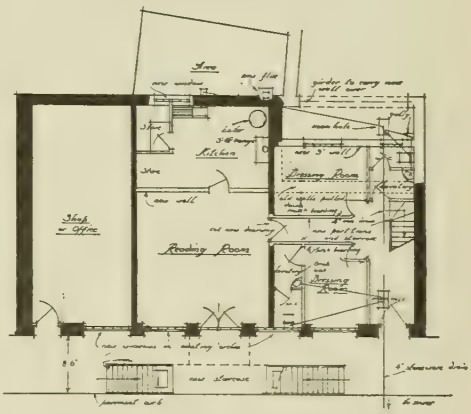
winning design in this competition, r. E. Vincent Harris, F.R.I.B.A., was ated in our issues for September 30 ctober 7, and the design submitted by E. Berry Webber, A.R.I.B.A., in our for October 14. We now illustrate the submitted by Messrs. Collcutt and , who have deemed it advisable to he new work as one building, and not o separate buildings. It was thought that the elevations of the new building, particularly that facing St. Peter's Square, unless treated as a continuous facade, would lose in dignity if and when the square is enlarged. The library building has been made a complete unit, entirely cut off from the Town Hall Extension and Municipal Offices. Emphasis of any of the several entrances of the building, except the one to the library portion, has been avoided, as it was felt that the existing principal entrance to the Town Hall should remain the dominant motif of the group of buildings.



Nottingham Market Place Competition.

We illustrate this week the design awarded third place in this recent competition, by Messrs. Falkner & Aylwin. Sir Edwin Lutyens was the assessor, in association with a local board. The winning design was illustrated in our issue for November 4.



Christ's College, Finchley.

This new building, which is to be opened on November 19 by Sir B. S. Gott, Secretary of the Education Committee of the Middlesex County Council, is L-shaped on plan, and has been erected on the south-western portion of the existing site fronting Hendon-lane, leaving unoccupied as much as possible of the former playground. It has a range of large, airy classrooms on two floors facing south and south-east, in order to obtain the maximum amount of natural lighting. An assembly hall, with a large gallery, occupies the north-western wing. There are staff rooms facing Hendon-lane, and spacious new cloakrooms have been provided on the south-west side. The main entrance is through an octagonal hall, with direct access to the main corridor or into the assembly hall. Staircases at each end of the main corridor provide easy access to the upper floor.

nd most elaborate type. The building

Leys School, Cambridge: New Science Building.

Mr. C. F. Skipper, F.R.I.B.A., Architect.

is faced with Daneshill bricks and stone dressings. The space in the tower above the first floor is devoted to the museum.

The general contractors were Messrs. C. Miskin & Sons, Ltd., St. Albans; and the following were sub-contractors:—Braithwaite & Co., Engineers, Ltd., steelwork and water tower; F. Bradford & Co., fireproof floors; Norris Warming Co., Ltd., heating; the Cambridge Electric Wiring and Repair Co., electrical installation; the Zeta Wood-Block Flooring Co., Ltd., wood-block flooring; Baird & Tatlock (London), Ltd., all laboratory fittings, etc.

The architect was Mr. C. F. Skipper, F.R.I.B.A., of Cambridge.

Dulverton Town Hall.

Dulverton Town Hall was built in 1864 at the expense of the Countess of Carnarvon. It is a building with an awkward external staircase and other inadequate arrangements. The reconstruction consists of the external staircase, the remodelling of the interior, the provision of stage dressing rooms, cloakrooms and refreshment room. The main portion of the building has been retained, the roof re-slated, etc.

The contractors were Messrs. G. B. Fisher & Son, Dulverton, and the supervision of the works on the spot was entrusted to Mr. Stoker, of Dulverton. Messrs. Richardson & Gill, FF.R.I.B.A., of 41, Russell-square, W.C., were the architects.

New Freemasons' Hall, Madras, S. India.

This building has been completed for the District Grand Lodge of Madras at a cost of approximately 2.8 lakhs of rupees, or about £21,000 sterling. This cost worked out at 10.75 annas, or approximately 1s. per cubic foot, the cubical contents being measured from the top of the concrete to the top of the roofs, which are flat. The accommodation consists principally of two lodge rooms on the first floor with their subsidiary rooms attached, and two dining-rooms on the ground floor with necessary service arrangements and cloak-room, etc. As is customary in South India, the kitchen block, consisting of European and Indian kitchens and stores, forms a separate building connected to the main building by covered passages. The building, on its western front, faces the Coum River, and the architects have designed a river terrace with grass slopes, but unfortunately the development of this suffered considerably owing to lack of funds.

In Madras, owing to the absence of building stone (except granite, the use of which for facing much delays progress), and owing to the poor quality of the bricks available, it is customary for the majority of buildings to be constructed of brickwork faced with plaster. The Freemasons' Hall is constructed in this manner, but the architects have attempted to revive the use of Madras fine plaster, famous some 100 or 150 years ago, but of recent years allowed to lapse into disuse.

The rosewood furniture to the large lodge room is to the architects' design, but existing furniture, for reasons of economy, had to be re-used in the smaller lodge room. The Memorial to Madras Masons who fell in the War, designed by Mr. Jackson, is placed at the head of the main staircase, and consists of a bronze tablet inscribed with the names of the fallen and their lodges, with rosewood surrounds. Wherever possible, the architects have utilised local materials and labour.

The architects who designed and supervised construction of the work were Messrs. Jackson & Barker, architects and civil engineers, of 22, Broadway, Madras, Mr. R. Jackson being responsible for the architectural design and detailing of the building and its equipment, and Mr. H. W. Barker, A.M. Inst.C.E., F.S.I., being responsible for the designing of foundations, reinforced concrete, steelwork, sanitary installation, and sewage disposal section. The consulting electrical engineer was Mr. C. V. Krishnasawmi Chetty Garu, B.A., B.Sc.(Tech.), A.M.I.E.E., and Mr. A. H. Barker, B.Sc., B.A., Whit. Sch., of 100, Victoria-street, Westminster, London, S.W.1, designed a scheme of artificial ventilation to the lodge rooms which unfortunately had to be abandoned owing to lack of funds. The clerk of works was Mr. K. Ganesa Iyer.

The general contractor was Mr. K. Raman Menon, of Madras, who, amongst other things, was responsible for the whole of the fine plastering already referred to and the joinery. The remainder of the work was carried out by various sub-contractors as follows:—The Kleine Patent Flooring Co. (India), Ltd., floors and roofs; The General Electric Co. (India), Ltd., electric equipment; Spencer & Co., Ltd., furniture for large lodge room and large dining-room; Lakshmi Ratans, Ltd., marble and tiled floorings, including tesselated pavement; Massey & Co., Ltd., water supply and sanitary installation; Jessop & Co., Ltd., steelwork; P. Orr & Sons, Ltd., bronze grilles, bronze opening ceremony tablet, bronze tablet for war memorial, and metal symbols for furniture; The Crompton Engineering Co. (Madras), Ltd., wrought-iron railings for main staircase and verandahs; Richardson & Cruddas, rainwater down-pipes; The Crittall Manufacturing Co. (India), Ltd., gearing to lodge room ventilators; Yannedis & Co., special door and window furniture; Leggotts, Ltd., gearing to dining-room ventilators.

An Architect's Estate.

Mr. Edwin Dace Brown, A.R.I.B.A. (46), of Kirkstall Gardens, Streatham Hill, S.W., left £1,410 (net personalty, £231).

CORRESPONDENCE

Salaries of Architectural Assistants.

SIR,—From the many requests which have been received for fuller information it would appear that there must be a large number of your readers interested in the comment in the issue of *The Builder* for October 28 on the proposal of the A.A.S.T.A. that there should be certain basic salaries for the payment of architectural services if rendered by salaried and assistant architects. Unfortunately a large number of them cannot have had the opportunity of reading the report which gave rise to these comments.

May I be given this opportunity of stating briefly the main points in the report? For nearly three years the R.I.B.A. and the A.A.S.T.A. have been negotiating on the question of the establishment of basic minimum salaries, not standard salaries, as some are inclined to suspect. Joint committees between the two bodies met on several occasions, and on each occasion an agreed recommendation was the result. The A.A.S.T.A is convinced of the urgent need of a minimum salary, and even agreed to a substantial modification of its original claim. It considered that the minimum salary agreed upon should be applicable to *all* salaried members of the profession, but consented to its restricted application to corporate members of the Royal Institute only.

The following recommendation was made by a committee to the conference of Allied Societies :—

"That the following scale of minimum salaries for Architectural Assistants be scheduled as reasonable by the R.I.B.A.; that members of the R.I.B.A. be advised to adopt it by the Council; and that the scale be published in the R.I.B.A. Calendar :—

"(1) For a junior assistant with not less than four years' training in an architect's office or in a recognised architectural school, or both, who has passed the R.I.B.A. Intermediate Examination, not less than—
Class A towns or districts, £3 10s. p.w.
Class B towns or districts, £3 5s. p.w.
Class C towns or districts, £3 p.w.

"These rates do not apply to persons who have had less than twelve months' full-time employment in an architect's office.

"(2) For an assistant with not less than seven years' training, who is either an Associate or Licentiate R.I.B.A., or has passed the Examination qualifying for election as Associate R.I.B.A., not less than—
Class A towns or districts, £6 p.w.
Class B towns or districts, £5 10s. p.w.
Class C towns or districts, £5 p.w.

"These rates do not apply to persons who have had less than twelve months' full-time employment in an architect's office. A schedule has been prepared showing the division of towns and districts into three classes, 'A,' 'B,' and 'C.' The schedule is based on the official grading published in the *Ministry of Labour Gazette* for wages in the building industry."

The conference sent the recommendation to the Allied Societies, which, after a year, submitted their observations, some in favour, some against, some neutral.

The above scheme and observations were then submitted without any recommendation to the R.I.B.A. Council, which has now, by a small majority, rejected the scheme in full. This rejection of a reasonable and generally agreed measure for the protection of a large section of the R.I.B.A. membership is to be deeply deplored in view of an already existing scale of charges for the protection of practising architects from unfair competition.

Now that a three years' silence is broken and the facts are available through the medium of the A.A.S.T.A., members of the R.I.B.A who are salaried principals or employers cannot fail to endorse your judgment and the opinion of the Association.

The R.I.B.A. Council does defend the rights of its practising members, and does protect their interests, and definitely refuses to grant an equivalent measure of protection to those of its members who are still or who must remain in the assistant class. In other words, the R.I.B.A. differentiates between its members.

JOHN MITCHELL,
General Secretaary.

Larkhall Estate, Clapham.

SIR,—I notice in your last issue, page 729, that the plan of the new flats, bedroom number three of the centre maisonette, has both the bathroom and the W.C. belonging to its own apartment and the bathroom and W.C. of the adjoining apartment separated from it by what looks to be a very thin partition. As a dweller for many years in flats, may I point out the extreme annoyance which arises when only a very thin partition exists between a bathroom and a bedroom.

This letter, of course, is not intended to be a personal criticism of the architects. It is intended only to raise the whole point of sound-proofing in designing similar buildings. If any reply should be forthcoming from them, however, they might reply also as to whether they have adopted any means for sound-proofing ceilings. In connection with this matter, a week or two ago in your inquiry column, somebody sent out an S.O.S. for some means of deadening noise from a flat above, and a reply is given in your last issue.

In an advertisement of my own inviting tenders for nurses' sleeping quarters, which I think occurs in the same issue of your journal, it may be of interest to note that in the plans I have taken particular pains to deaden sound between floors and between bathroom walls and bedrooms.

"F.I.A.A."

Herne Bay Municipal Offices Competition.

SIR,—I should imagine that the award in connection with this competition has caused considerable surprise to many of the competitors. On the bank plan supplied it stated that this was only intended to indicate the necessary accommodation and *dimensions*, but not the disposition of rooms. The wording of this was queried by several of the competitors, but they were referred to "see note on plan."

The overall dimensions on the bank plan supplied read 60 ft. by 24 ft., but these have been utterly disregarded by the competitors placed first and second. It must be realised that the placing of this bank and the area it occupied affected the whole of the planning of the scheme. We all know that very often a finer plan may be achieved by disregarding the conditions, but since in Clause 9e of the general conditions of the competition it states that a design shall be excluded from the competition if any of the conditions or instructions other than those of a suggestive character are disregarded, I claim that it is hardly fair to the majority of the competitors who kept rigidly to the conditions to be over-ridden by some who made their task infinitely easier by ignoring them.

It appears that imposing conditions is one thing and enforcing them another. Surely the assessor has a very important duty to all competitors to see that the conditions imposed by him are strictly adhered to.

"A.R.I.B.A."

[***We understand that the conditions of the competition stated that the areas and sizes in the schedule were approximate and could be varied to suit circumstances of planning. The conditions further stated that the primary object was the provision of Municipal Offices and business premises. The winning design was awarded the first premium, because in the opinion of the assessor it revealed a finer adjustment of the conditions than any of the other designs.—ED.]

Penetration of Daylight and Sunlight into Buildings.

We have received from Mr. Percy Waldram a letter referring to a publica of the Department of Scientific and Indus Research on "The Penetration of Dayl and Sunlight into Buildings." This pub tion, says the writer, is an epitome of n months of work by the Advisory Comm and the National Physical Laboratory. believed to present, in a form capabl ready assimilation by architects and desig our present knowledge of the subject of light, in which this country is believe be well ahead of others.

Association of Special Libraries and ation Bureaux.—The Council approved ommendation of the Literature Stand- mmittee that the R.I.B.A. should be- nembers of the Association of Special es and Information Bureaux.

erence on Garden Planning.—Mr. Gil- . Jenkins was appointed to represent I.B.A. on a Committee of the Confer- n Garden Planning which the Royal ltural Society propose to hold in ber, 1928.

Royal Sanitary Institute Congress at ys.—A report was received from Mr. Searles-Wood and Lieut.-Col. P. A. s, the R.I.B.A. delegates at the re- ngress of the Royal Sanitary Institute ings. The hearty thanks of the Coun- e conveyed to Mr. Searles-Wood and Col. Hopkins.

ntship.—The following were elected s of the R.I.B.A. :—

dam (Glasgow School of Architecture), Amos (McGill University, Montreal), Beveridge (Architectural Association), Bowden (Special Exemption), V. E. Birmingham School of Architecture), Cordiner (Glasgow School of Architec- . S. Cordiner (Glasgow School of ture), P. G. Freeman (University of ol), L. P. Furois (McGill University, l), J. B. Gold (University of Cam- D. G. Hardie (Edinburgh College of . B. Hillier (Architectural Associa- N. Holt (University of Liverpool), ng (Glasgow School of Architecture), ivingstone (Glasgow School of Archi- A. S. Macduff (McGill University, d), A. MacLean (University of Man- J. Maitland (Glasgow School of ture), J. L. Martin (Special Exemp- McGrath (Special Exemption), A. K. cGill University, Montreal), G. F. Architectural Association), W. H. M. rchitectural Association), W. J. R. Thackwell (Special Exemption), D. (University of Liverpool), Jean ead (Architectural Association), H. D. n (McGill University, Montreal), obinson (McGill University, Mont- H. Rogers (Birmingham School of ure), T. E. Salvin (Sheffield Univer- E. Schofield (Cambridge University), S. H. Schwartzel (Special Exemption), L. G. Stokes (University of London), J. R. Tolson (Leeds College of Art), J. S. Walkden (University of Manchester), Mary Leonora Wilkinson (Architectural Association).

Retired Fellowship.—The following members were transferred to the Retired Fellowship :—

Walter J. N. Millard, elected Associate 1885, Fellow 1921.

Charles Harrison Townsend, elected Fellow 1888.

Resignations.—The following resignations were accepted with regret :—

James Henry Coram, A.R.I.B.A.

Langton Dennis, A.R.I.B.A.

Applications for Election as Licentiates under Section III (f) of the Supplemental Charter, 1925.—Two applications were approved.

Application for Election as Subscriber.—One application was approved.

The late Mr. George Northover.—The President referred to the sad news of the death of Mr. George Northover, and spoke of the valuable services which Mr. Northover had rendered to the Institute for so many years as Editor of the *Journal.* On the proposition of the President it was unanimously resolved that an expression of the deep sympathy of the Council be conveyed to the relatives of the late Mr. Northover.

LEEDS AND WEST YORKSHIRE ARCHITECTURAL SOCIETY.

In the course of his opening address to this Society, the President, Colonel Albert E. Kirk, O.B.E., A.R.I.B.A., having referred to the fact that the Society were now in possession of a very beautiful suite of rooms in every way suited to their requirements, said, with regard to membership, they were in a flourishing condition—the Society never had more members; but it was the duty of architectural practitioners in their area who were members of the R.I.B.A. to join the allied society and take an active interest in the politics of their profession. He had felt for a long time that with such large towns in their area as, for instance, Bradford, Huddersfield, Halifax, etc., the time had come to form in those towns a branch of the Society where they could meet and discuss local matters. That had been done in one or two allied societies, with good effect. If members of the Society residing in those towns felt interested in the idea, he was sure the council would be pleased to discuss it with them. Turning to the question of preserving the countryside, the speaker said most of the societies which had grown up in the last year or two for that purpose were endeavouring to check the erection of ugly houses—those same houses whose erection the Government was encouraging. Whereas seven years ago the Ministry of Health, or, at any rate, its temporary staff, scrutinised lay-outs, plans, and elevations, suggesting and sometimes insisting upon amendments, to-day the Ministry of Health or, at any rate, its permanent staff, was concerned merely with numbers. There must be more houses, no matter that they be ever so ugly; no matter that they spread here, there and everywhere, singly, or sprawling formlessly along England's shores; no matter that they impudently spawned adjacent to England's most venerable monuments or sprang up promiscuously in the midst of her loveliest landscapes; no matter that they were built of blocks and slabs of any material that could be compressed into temporary adhesion —the aim of those in authority was to obtain quantity, not quality.

He did not think that it was generally known that in the Housing (Rural Works) Act, 1926, financial assistance was available both for converting into dwellings of buildings not previously used for that purpose, and for the improvement of existing dwelling accommodation. Amongst the applications which would be made for financial assistance, perhaps the largest proportion would be concerned in making dilapidated houses which were situated in areas of no particular interest, as, for instance, in completely spoiled manufacturing areas, or among groups of buildings that had no architectural character whatever and which in themselves were of a most commonplace description. However, a large proportion of cases in connection with which assistance would be sought might be old cottages and farm buildings of pronounced architectural character and traditional value, which it was of the greatest importance to retain. It was in the reconstruction of such buildings that the assistance of a well-qualified architect was of the utmost importance. It might be that there would be cases where such architectural assistance would not be easily available, and where the work might necessarily be carried out without professional assistance. In such cases, timely advice and reference to well-established principles would be of great value to those responsible. In order to provide help and assistance, the C.P.R.E. had done well to lay down general rules for guidance.

EXHIBITION NOTES

THE GOUPIL GALLERY.

The seventeenth exhibition of a series of pictures inaugurated with a view to bringing together the works of artists of various tendencies is now on view at the Goupil Gallery Salon. There can be no doubt about the variety of the tendencies, and it is difficult to see how anyone with artistic insight could find any artistic value in the major part of them. Claude Monet's beautiful "Varengeville," the "Inner Chamber, Portsmouth," by W. Linac Barnett, the "Cottages at Montreuil-sur-Mer" by Charles Genge, "Sweet Williams" by A. Davis Richter, "On the Cotswolds" by A. M. Hind, and "Demolition, Bank of England," by J. F. Wilson, are easily singled out from the others for either interest of subject or excellence of colour and drawing, but it is really impossible not to wonder why so many of these things are exhibited at all.

COLNAGHI'S GALLERY.

The fine modern pottery exhibits at the Colnaghi Gallery in Bond Street have attracted much notice, and it is a great pleasure to see there is a vogue for such beautiful shape and colouring. Nearly all the exhibits have an interest of their own, and this is an exhibition which should not be missed.

St. Paul's Cathedral.

Captain Stanley Peach, F.R.I.B.A., has been the representative of the R.I.B.A. on the St. Paul's Cathedral Preservation Committee since that body was established. In recognition of the very valuable services which Captain Peach has rendered in this capacity, the Council of the R.I.B.A. will entertain him at luncheon at the Burlington Hotel on Tuesday, November 15. Canon S. A. Alexander, Mr. Mervyn Macartney, the architect to the Cathedral, Mr. Basil Mott, and Mr. W. Godfrey Allen, the assistant architect, will also be present as the guests of the Council.

"Stone House," Streatham Hill.

We learn that the demolition of No. 54, Streatham Hill is now under way, preparatory to the erection on that and other adjoining sites of a cinema and dance hall. The passing of this old house occasions more than usual interest, for it was formerly the residence of Mr. Malcott—builder of the National Gallery, Trafalgar-square—and was constructed, according to accounts, out of the stones of the old Royal Mews, erected in the reign of James I and pulled down to make way for the Gallery. According to a local history "Streatham Old and New," the frieze round the top of the house is part of that which once adorned Carlton House, and the stone walls in the forecourt came from old London Bridge.

ST. PAUL'S: WORK OF PRESERVING THE FABRIC

A MEETING of the Representative Committee for the preservation of St. Paul's Cathedral was held recently at the Deanery, St. Paul's. The fifth report on the preservation was read, extracts of which are as follows:—The work of preservation at St. Paul's Cathedral has continued to proceed satisfactorily during the period that has elapsed since the last report, dated January 10, 1927. In the first paragraph of that report it was stated that various measures had been taken to increase the rate of progress; these measures have proved successful, and a material advancement has been obtained. The consolidation with cement and the reinforcement with rustless steel rods of all the eight main piers in the crypt have been completed. The timber strutting has been cleared away, the memorials and tablets have been replaced, and considerable progress has been made in the elimination of all evidence of the work carried out and in the restoration of the face of the masonry to its original appearance. It is now practically impossible to discern where the holes have been drilled. The crypt has been fully open to the public again for several months past. The drilling, cementation and reinforcement of all the eight main piers from the level of the church floor upwards has made steady progress, and, on the average, has reached half-way up to the main cornice. The replacement of the iron ties, mostly fractured, inserted between the piers and bastions at the gallery level during the original construction, by a much stronger system of rustless steel ties is nearing completion, two of the four groups being finished, the third nearly so, and the fourth started.

In drilling the holes for the new ties, valuable information has been obtained as to the state of the interior of the piers both before and after the cement injections. Cores have been recovered from holes drilled after injection and the injected cement is found to be filling all cavities in the core and to be adhering closely to the stone and mortar. It has occasionally been possible to obtain specimens of injected cement from these cores large enough for testing, and they have shown a resistance to crushing greater than that of Portland stone. A scheme of bracing between the drums from the level of the Whispering Gallery upwards has been approved in principle; detailed designs are now being prepared for final consideration.

In carrying out the work it has not been found necessary to make any material deviation from the recommendations contained in the report of the Commission of Architects and Engineers, dated February 14, 1925. The series of levelling, plumbing and theodolite observations and of linear measurements have been continued at regular intervals and also the readings of the crack measurement plugs, with the result that no evidence of settlement in the foundations nor of injurious movement in other portions of the dome structure is to be detected. The observation and plotting of the theodolite survey of the dome area, including the piers, bastions and arches, have been completed, and it is proposed to extend this survey to other portions of the structure, and to complete the architectural survey.

The expenditure on the preservation work generally by the Works Sub-Committee since the date of the last report is about £44,000, making with what has been previously expended a total to date of £91,550. The report was signed by Mr. Basil Mott, as Chairman of the Works Sub-Committee.

Restoration of the Beauchamp Chapel, Warwick.

We understand that a sum of £3,451 has been expended upon the work of restoring the Beauchamp Chapel, Warwick. Discoveries made during the summer and the extra work found to be necessary in strengthening the floor damaged by the fire of 1694 have delayed matters, but it is hoped to have the restoration completed within the next few weeks.

WEEK IN PARLIAMENT

Westminster, Wednesday.

Slum Clearance Schemes.

Sir K. Wood informed Mr. E. Brown that since January 1, 1925, 41 slum clearance schemes, involving 4,439 properties, had been confirmed by the Ministry of Health. The number of persons required to be rehoused under these schemes was 24,590. By September 30 last, the latest date for which the information was available, tenders had been approved or loans sanctioned for the erection of 1,976 new dwellings towards the provision of accommodation for the population which was being displaced under the schemes in question, and 864 of these had been completed. The following was the list of local authorities whose schemes for slum clearance within their areas had been confirmed since January 1, 1925:—Banbury T.C., Barking Town U.D.C., Bath T.C., Bermondsey M.B.C., Bristol T.C., Cheltenham T.C., Chester T.C., Darwen T.C., Finsbury M.B.C., Halifax T.C., Hitchin U.D.C., London C.C. (five schemes), Newcastle-on-Tyne T.C. (three schemes), Norwich T.C. (two schemes), Oldbury U.D.C., Oldham T.C., Otley U.D.C., Poole T.C., Poplar M.B.C., Rawtenstall T.C., Rotherham R.D.C., St. Albans T.C., St. Pancras M.B.C., Sheffield T.C. (two schemes), Stepney M.B.C., Stockton-on-Tees T.C., Sunderland T.C. (two schemes), Torquay T.C., Welshpool T.C., West Bromwich T.C., Worcester T.C., and York T.C.

Rent Decontrol.

Mr. R. Morrison asked the Minister whether his attention had been called by local authorities to the urgent necessity of legislation to protect tenants against excessive increases in rents after property was decontrolled, and whether he proposed to take any action.

Sir K. Wood said that the member had received an identical resolution on the matter referred to from a number of local authorities. It was proposed to provide for the continuance for one year of the Rent Restriction Acts in their present form by including them in the Expiring Laws Continuance Bill. If that was done no amendments would be practicable.

London Squares.

The Royal Commission on London Squares met at the House of Lords on Tuesday (Lord Londonderry presiding), and heard evidence from Mr. Frank Hunt, the valuer to the London County Council.

Mr. Hunt reminded the Commission that the L.C.C., by a resolution dated April 12, 1927, requested the Government to institute an inquiry into the question of the London squares. The Council felt that further information as to the circumstances of the squares in many respects was necessary before a scheme for their preservation could be formulated. In seven Metropolitan boroughs—Kensington, Westminster, St. Pancras, Holborn, Chelsea, St. Marylebone and Paddington—were comprised nearly 60 per cent. of the number and nearly 78 per cent. of the area of all the squares in London. There were 194 squares north of the Thames, and only 37 in the south. In five Metropolitan boroughs—Kensington, Paddington, Camberwell, Islington and Westminster —were comprised 46 per cent. of the number, and nearly 66 per cent. of the area of all the enclosures in London.

A feature of the building development by squares which needed to be particularly noted was the absence, in many cases, of gardens to the individual houses. On some squares the houses were built back, or only with a small lighting well. In other cases there was a small space at the rear not exceeding 10 ft. In others there was a garden of about 50 ft., but in very few was there extensive space appropriate to the class and value of the houses. It followed, therefore, that, excluding the garden square, a very high proportion of the site was covered by buildings; and even taking the garden square into account, the proportion of the land covered was in most cases high. Thus, in the of Portman-square, taking the houses al about 82 per cent. of the land was cove while including the garden square (2.56 a the proportion was about 54 per cent.

Under the Town Planning Act, buil density was one of the matters that always stringently regulated, the hig density usually authorised by town plan schemes being 12 houses to the acre for w ing-class development, including the hou estates of local authorities. This in pra meant that the land was, on the ave covered with buildings to somewhat less 20 per cent. of its area. There was, u town planning schemes, a further limita on the proportion of any building plot could be covered which, it was gene provided, should not exceed, for houses exceeding 30 ft. in height, one-third, an houses exceeding 30 ft. one-fourth. limitation of density was without compe tion, it being provided in the Town Plan Act that this, among other things spec was not to be the subject of compensati

The question of taking action for preservation of squares under the T Planning Act had been under the consi tion of the London County Council. Act applied to land which was in cours development or appeared likely to be for building purposes, and under this it w no doubt be possible to make a t planning scheme for a square propose be built on. To preserve it under a sch however, it would be necessary to sch it as a public or as a private open space the former, it would be necessary unde scheme to purchase the square, and i latter, to pay compensation in respe prohibition against building on it, an was possible that, in certain circumsta the cost in the latter would not be less than in the former.

The L.C.C. had not applied the prov of the Town Planning Act to any indi square. They had done so in respect area in Bloomsbury, one of the chief o of the proposed scheme being the pre tion of the garden squares in the neigh hood.

Answering Col. Vaughan-Morgan, th ness said he was not sure that the ap tion of the Town Planning Act necessarily protect the squares and encl in their present form from future build

Sir George Duckworth asked what w attitude of the speculative builder.

Mr. Hunt said that such a person put on a site the very maximum thi law would permit, and would tamper any rights of owners of adjoining pr that he felt he could safely tamper.

The Commission then adjourned.

Landlord and Tenant Bill.

During the concluding stages of the lord and Tenant (No. 2) Bill in the H Commons, Mr. Withers moved an ment to Clause 3, to add to the conditi which a tribunal might certify that provement was a proper improvement, t dition that it would not prejudicially the amenities of the neighbourhood. that, while fulfilling all the requirem the Bill as it stood, an improvement be greatly against the public interes

Sir W. Joynson-Hicks, the Home tary, said that they were all desirous serving the amenities of a neighbo but this Bill related solely to landl tenant. It would not be right to i clause of this kind into such a might suitably be inserted in a town-p Bill.

Mr. Rye suggested the addition following words to the amendment: terfere with or destroy any histo architectural feature attaching to a of the premises."

Sir W. Joynson-Hicks said that Withers would try to draft some words to carry out the purpose of his ment, he would consider them.

Mr. Withers agreed to this suggest withdrew his amendment.

THE SURVEYORS' INSTITUTION

Presidential Address.

Monday evening last, Mr. E. S. Cox red his opening address before the yors' Institution. Having touched upon iety of topics of professional interest, id that a matter that would appeal ally to country land agents was the tion of the countryside. There was no whatever that much of the loveliness al England was being ruined. Owing high cost of road-making people who houses and bungalows naturally went they could build without incurring the se of road charges, and so it happened long our country roads and lanes houses ungalows were breaking like a rash the face of what once was a lovely yside. The buildings were frequently ugly style of architecture and out of ny with the surroundings. Ornamental was cut down, ferro-concrete bridges, of hideous design, spanned the streams, etrol stations with their pumps of many s sprang up here, there and everywhere t thought as to whether their garish ance and the noise created by their ers was not ruining the charm of our quiet villages. All art and beauty l, in fact, to be giving place to a de- g utilitarianism. Surely with a little t these things need not be. We should sh Godspeed to the Council for the vation of Rural England, which was i with the object of preserving the l beauties of our country.

was glad to find that some of our towns ities were inserting clauses in their l Powers Bills by which an advisory ttee consisting of a member of the ouncil, a nominee of the Royal Insti- British Architects, and a nominee of rveyors' Institution would advise on vations of new buildings. This seemed in the right direction, and should do ing to extend to urban areas the move- nitiated by the Council for the Preser- of Rural England. Doubtless the de- ent of town planning in rural as well rban districts would also tend to check able development.

general recognition of the necessity for ation between neighbouring authori- l led to the formation of a number of l committees, particularly in the urhood of our great centres of popula- id although the functions of these com- were mainly advisory, one effect of formation was to stimulate public in town planning and extend the o which it was being applied. The c development of a ribbon-like form he lines of traffic routes in our rural s would doubtless be checked, or at ontrolled, by town-planning schemes l by those committees. The extent to the movement had spread since the Act was passed in 1909 was demon- by the figures, which showed that ere 601 schemes proposed or in opera- September 30 last comprising 3,057,647 Obviously town planning had become gnised policy for the future develop- our country, but the subject of plan- al areas in particular opened out im- and difficult problems, and it was, ured to suggest, for members of the rs' Institution to see that the inter- the community and of their clients ved in solving those problems. With forethought and mutual consideration emed no reason why those separate should not be brought into harmony. ere other problems which confronted an surveyor and his client. Of these one of the most urgent was the basis hich compensation for land acquired ompulsory powers in an unhealthy ould be calculated and paid. That w regulated by Section 46 of the Act, 1925.

to 1919 compensation in respect of unhealthy areas acquired by local authorities for reconstruction was assessed upon the basis of fair market value of the land and buildings upon it, regard being had to the nature and condition of the property, the state of repair of the buildings, and the probable duration of the structures in that state of repair. If the houses or premises were unfit and incapable of being made fit for human occupation, the owner could only obtain the value of the site plus the cost of the building material, and nothing for the building as such.

Upon the face of it this arrangement would appear to be one which was both equitable to the owner and reasonable so far as the local authority was concerned. In practice, however, it was found that the method of assessing the compensation was costly to the acquiring authority. The basis of assessment was not the value of the land for the purposes for which it was usually acquired by the authority, namely, housing, but was calculated according to the possibilities of the site for industrial or commercial development. Moreover, in some cases compensation had to be paid for the buildings, even though they would have to be pulled down to carry out the scheme of improvement. Those difficulties in practice did much to hinder local authorities from dealing with areas which, in the interests of sanitation and public health, it was urgently necessary to reconstruct. Section 9 of the Housing and Town Planning Act, 1919, was passed in order to remedy the difficulty, and introduced new principles of assessing compensation. These were, firstly, that compensation should be limited to the market value of the cleared site; and, secondly, that such market value was to be reduced according to the manner in which the acquiring authority subsequently used the land. The object of those two principles when combined was, at any rate in theory, to remove the burdens which had fallen upon the acquiring authorities and the resulting loss to ratepayers. In 1925 this section was re-enacted as Section 46 of the Housing Act of that year.

The hardship and injustice which this section had caused to individuals whose property had been coloured *red* under a reconstruction scheme, although either in perfectly sound and tenantable repair or capable of being made so, were now too well known to need prolonged discussion. The pendulum of unreasonableness had swung the other way, and the burden had been shifted from the ratepayers' shoulders to those of a particular class of the community—the owners of small-class property, men and women frequently of slender means. The Unhealthy Areas Committee, of which the present Minister of Health was chairman, reported finally in April, 1921, and emphatically condemned the principles of compensation now enunciated in Section 46. "Its drastic provisions," the report states, "are considered likely to lead to such inequality and injustice between individuals as to encounter violent opposition. Owing to the inequity of paying nothing for buildings which in themselves might be unexceptional, but which happen to be in an unhealthy area, it is suggested that the local authority will be deterred from representing areas as unhealthy. Moreover, the task of the local authority and the Minister of Health, in deciding upon the use to which the land shall be put in the future, will be rendered extremely difficult by the fact that upon that use will depend the compensation payable to the owner."

These statements were made six and a half years ago in the report of a strong departmental committee which recommended that compensation should be based, not as laid down in Section 46, but upon the assumption that the present user of any buildings on the site would be stabilised for an arbitrary period of ten years, a recommendation which might, in practice, have proved a reasonable compromise. It received the approval, in principle, of the Association of Municipal Corporations, a body whose opinions were not open to the criticism that they were likely to be unduly favourable to the property owner.

In November, 1925, the Institution urged upon the Minister of Health that, until remedial legislation was enacted, local authorities should be required to differentiate between premises actually unfit for habitation and those in a reasonable state of repair, although situated in an unhealthy area. Nevertheless, in 1925, when the legislation on housing and town planning was separated under the two Acts of that year, Section 9 of the 1919 Act was re-enacted as Section 46 of the Housing Act, 1925. Again, in December, 1925, the Council presented to the Minister a Memorandum upon the operation of the section. It recommended that the reduction factor should be eliminated, and the land paid for at its value as ascertained under the Acquisition of Land Act, 1919; that property not in itself insanitary, but included in a reconstruction scheme, should be treated on the same basis as property acquired for road widening or public improvements under the Acquisition of Land Act, 1919; that where it was uncertain whether property should be treated as insanitary in itself or not, the official arbitrator should have power to award compensation in excess of the site value, but less than that awarded for property recognised as being sanitary; and that compensation should also be given for disturbance of business and for the cost of removal of plant and machinery.

Those views had since been urged upon the Minister by interview and by letter, and Mr. Chamberlain had on several occasions, notably at the annual dinner of the Institution in March last, declared his intention of introducing amending legislation. This he subsequently repeated in the course of the debate last session on the second reading of the Liverpool Bill, Clause 94 of which directly repudiated the principles laid down by Section 46. In spite, nevertheless, of its admitted injustice and of condemnation by those with power to enforce it, as well as by bodies of impartial persons with experience of its operation, the section remained in force. Mr. Chamberlain, however, had shown that he recognised its unfairness, and they must hope that this fact, combined with his promises of an amending measure, would result, in spite of the congestion of the Parliamentary calendar, in the early disappearance of the section from the Statute Book.

Country Cottages for Slum Dwellers.

The first ten houses of the Cheltenham Homecroft Settlement are almost completed, and, according to the *Times*, the first homecrofters in England will shortly move into their homes on the Tewkesbury-road, on the outskirts of Cheltenham. The settlement is an attempt to enable persons now living under slum conditions to move into the country, to draw wages for their industrial work in the town, but to produce in their gardens food for sustenance and not for sale. Each house is a detached cottage, built of concrete slabs in hollow walls. On the ground floor there is a sitting-room, 15 ft. by 10 ft., a kitchen with a cooking-stove, a bathroom, a larder, and a cold store. Upstairs there are three bedrooms and a large hanging cupboard. All the rooms have two windows. The garden contains an animal house, with accommodation for six pairs of rabbits, two stall-fed goats, ten or twelve laying hens, and a spare space for a tool-shed. There are also pillars for fruit trees, and the garden will be stocked with apple and other trees. The net weekly rent for the house, garden, and animal house is 12s. 6d. A further 3s. 9d. will be paid for 25 years only in order to enable the tenants to buy their crofts as an absolute freehold. The ten crofts will be formally opened by Lord Beauchamp on November 19.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

Subsidy Question.

SIR,—As an owner-builder, I recently obtained a certificate for the subsidy, and erected a bungalow. The usual difficulties offered by local councils to amateurs were overcome, but the subsidy has been refused on the grounds that the bungalow cost more than £625. I have rendered an account of the cost of labour and material totalling £623, and explained, of course, that my own efforts, and some minor items (paints, etc.), which were given me, had not been included, as they cost me nothing. Are there any further steps I can take to obtain the grant?

C. O. W.

Exterior Treatment for Bungalow: Damp Wall.

SIR,—(1) What is the best method of treating the outside of a bungalow which is well exposed to the sun? It is made of pitch pine weather boards, and has been coated with creosote. I have to paint three coats of white, and would like your advice on the first coat. Would spirit varnish be best?

(2) I have just papered a room which showed damp marks all over the walls, taking the colour out of the paper. I have treated the whole of the wall with a damp resister, three coats, but 18 in. above the skirting is all mouldy, and there is white mildew on the paper. I propose to put a brick ventilator in the frieze near the window between the door and the fireplace. Would this have the effect of sending a circulation of air through the room without being draughty? The room is a small dining-room, 9 ft. by 13 ft.

G. G.

Iron or Lead Pipes?

SIR,—Would you inform me whether a builder is allowed to fix iron pipes for water supply over sinks or lavatory basins, or if it is compulsory to supply lead piping?

F. L.

Recovery of Fees.

SIR,—In a case where tenders are obtained and the signing of the contract and commencement of work are postponed indefinitely, and there is no agreement between client and architect as to fees or two-thirds instalment, would the architect be likely to succeed in a claim for the instalment when the work is postponed, or is he expected to wait until the work is proceeded with? Would the R.I.B.A. scale of fees and the conditions therein be recognised in court in the case of the architect concerned being a NON-MEMBER?

Deviation from Contract.

[REPLY TO "SETTLING UP," NOVEMBER 4.]

SIR,—If the materials have rightly been obtained by the contractor, under, and in accordance with, the terms of the original contract, and prior to any variation order being given him, then he is entitled (in the absence of any express provision to the contrary) to full payment for all the materials so obtained, even though they are not used in the work because of deviations being made in the work as originally contracted for. In the event of a dispute arising, no custom would upset this rule; for it must be remembered that if, during the course of the work, such deviations are made as prevent the contractor performing his contract, then, unless the contract provides otherwise, there is a new contract set up in regard to the modification referred to; and the contractor is entitled to payment for all labour and material which he did in fact provide, or was at all times willing to provide, under the terms of his original contract.

A contractor taking material into store in the manner described should not suffer loss. In any case it is a matter for amicable adjustment if the contractor is willing to run the risk of having them on his hands. When the materials are to be stored some years their present value may be small.

LAW.

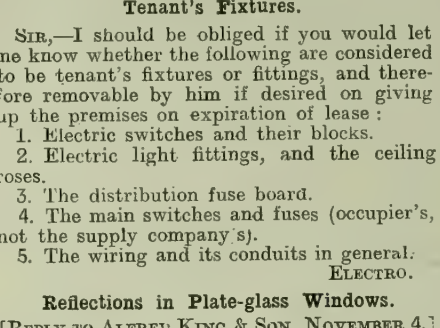
Floor-Covering Composition.

SIR,—Can you suggest any composition suitable for covering the wooden floors of an old windmill, which are somewhat rough and patchy, so that the rooms can be used as living rooms?

BM/FAW4.

Tenant's Fixtures.

SIR,—I should be obliged if you would let me know whether the following are considered to be tenant's fixtures or fittings, and therefore removable by him if desired on giving up the premises on expiration of lease:



1. Electric switches and their blocks.
2. Electric light fittings, and the ceiling roses.
3. The distribution fuse board.
4. The main switches and fuses (occupier's, not the supply company's).
5. The wiring and its conduits in general.

ELECTRO.

Reflections in Plate-glass Windows.

[REPLY TO ALFRED KING & SON, NOVEMBER 4.]

SIR,—If your correspondents will alter the front as shown on accompanying plan they will probably effect a cure of the reflection

trouble. Attempts have been made to cure this defect by tilting the shop front glass, but this is expensive and may be dangerous.

H. BOOCOCK.

Road Construction.

[REPLY TO "DRYSITE," NOVEMBER 11.]

SIR,—The question was clearly put by "Drysite" in your issue for August 26 and understood. In the circumstances now described, "Drysite's" remedy appears to be in an action against the local authority for "misfeasance," i.e., for the improper performance of a legal act by them in such a way as to interfere with the legal right, vested in him, in the land, and for damage in respect to the property being depreciated as described. The matter should be properly represented, and legal aid obtained before proceeding.

LAW.

Ownership of Documents, etc.

[REPLY TO "LANCASHIRE," NOVEMBER 11.]

SIR,—In further reply, "Lancashire" might refer to Section 5 (1) (b) of the Copyright Act, 1911, for useful information touching the matter he has raised, and if recovery of the book of measurements, etc., is essential, an action might be commenced, in the County Court, claiming possession and damages. This would ensure discovery and possession at least during a stage of the proceedings, which might suffice. It is not an easy matter, and with this information, and that previously given, "Lancashire" should seek legal advice direct. No instance is known of a clerk or other person being ordered to give up books, etc., as instanced by "Lancashire," and it may be that the Court will decide that copies of entries relating to the work already given must suffice. As to whether the building owner has the power to make the claim will need to be tested in the manner suggested. No ruling case is known.

LAW.

Contract Penalty.

[REPLY TO "DUB," NOVEMBER 11.]

SIR,—It is a well-recognised rule of law, that when a contractor fails to complete the work he has contracted for by a specified day, and this has been brought about by the other party to the contract, he is exonerated from the performance of the contract by that date—which has been thus rendered impossible. If, therefore, the building owner has ordered extra work beyond that specified in the original contract, as is here admi he cannot claim the liquidated damage non-completion provided by the cont unless, by the terms of the contract, contractor has agreed that whatever tional work may be ordered, he will n theless complete the works within the originally fixed. The R.I.B.A. For Contract does not so provide, but o contrary provides for extension of tim "extras." The contractor would the appear to have a good case, and the pen are not deductable. (See Dodd v. Chu 1897, 1 K.B. 562, and Chap. VI., Cro on Building Contracts.)

PENAI

Question of Maintenance.

[REPLY TO "FRONTAGER," NOVEMBER

SIR,—Any arrangements made as t provision of, and maintenance of, grass to the footways in any new street matter for agreement with the front i.e., the owners of the frontages conc and not merely with the occupiers. An authority has no power to vary the re ments of their by-laws as to the w specifications, etc., of new streets in district, and if they do so, then any s excess of the proper charge must be by that authority. It follows, therefor the local authority cannot demand th frontagers shall maintain the verges latter object. If the verges are provi face of the objections of the frontagers the cost of maintenance is a charge district rates, i.e., on the whole of th trict rates. If, however, the fron agreed to the provision of the verges outset, and to maintain them, the agreement could be enforced by authority.

MAINTENA

Zinc Roof, and District Surveyor

[REPLY TO ZINC, NOVEMBER 11.]

SIR,—The district surveyor is cor with new buildings and structural alte or additions to old buildings. He is n cerned with repair work except in so arising out of the dangerous conditio structure.

PRAC

Overhanging Guttering.

SIR,—I have purchased a piece of la find that the boarding and gutterin hang the flank wall at the side. If to go higher than the adjoining pr should I be compelled to make g putting a lead gutter from front to b

Measurement of Sub-Contractor's W

SIR,—A builder enters into a c usual R.I.B.A. Form (quantities for of the contract), and the specificati bills of quantities state that certain are to be executed at X sum pe super, by a firm nominated by th tects.

The contractor contends as follows

(a) That the quantity surveyor right in claiming to measure an direct with the sub-contractor for ter's work.

(b) If he wishes to measure this must do so with the contractor's rep tive only.

The contractor admits that the surveyor has a right to see the invoi only for the purpose of verifying or ing the p.c. rate or unit per yard. fore it would appear if by tight m the contractor's and specialist's ments are less than the quantity by contractor and the quantity surve contractor should have the benefit. pression of opinion as to whether tractor is within his rights in maki (a) and (b) would be valued.

MEA

Flooring Preparation.

SIR,—I shall be obliged if any advertisers can inform me whether a reliable preparation on the mar can be applied to flooring laid on a bed, in order to prevent the "sv that takes place when covering of is placed on the boards.

AN

THE BUILDING TRADE

UILDING CONTRACT IGNED AS SECURITY

SE—Cottage Club Estates, Ltd., *v.* de Estates Co. (Amersham), Ltd.—is briefly reported in the *Weekly Notes*, ber 12, and we consider that attention be called to it at once. By a contract December 15, 1925, between the claim- ntractors and the respondents' build- ers, the contractors were to build six- uses at Rickmansworth. By clause 15 ontract, any dispute arising under the t was to be submitted to arbitration ngle arbitrator under the Arbitration 89. On August 30, 1926, the contrac- deed of mortgage assigned to a bank oneys due or to become due under the t" to hold unto the mortgagees abso- subject to the usual proviso for re- n, as security for an overdraft of

ites subsequently arose between the tors and building owners as to the due under the contract in respect of ises built, and these were referred to tion under the above clause. The g owners contended that the contrac- ere not entitled to claim from them, assigned their rights to the bank, an ent of which due notice had been

arbitrator made his award in an alter- form, holding that the contractors ntitled to £448 from the building unless the building owners were right r contention, and the question was as a special case for the opinion of the

n 136, subsection (1) of the Law of y Act, 1925, which reproduces nearly n section 25, subsection (6) of the ure Act, 1873, provides: "Any abso- gnment by writing under the hand of gnor (not purporting to be by way of only) of any debt or other legal thing n of which express notice in writing n given to the debtor trustee or other from whom the assignor would have titled to claim such debt or thing in s effectual in law (subject to equities priority over the right of the assignee) and transfer from the date of such (*a*) the legal right to such debt or action, (*b*) all legal and other reme- the same and the power to give a charge for the same without the con- of the assignor, provided that if the rustee or other person liable in re- such debt or thing in action has that the assignment is disputed by gnor or any person claiming under (*b*) of any opposing or conflicting such debt or thing in action he may inks fit either call upon the persons the claim thereto to interplead con- the same or pay the debt or other action into court under the pro- f the Trustee Act, 1925."

contended by the building owners effect of the subsection was to trans- the date of notice of the assignment the legal right to the debt under (*a*) rst part of the subsection, but also al and other remedies" under the heading (*b*), including the right to . and that it divested the contractors ght to claim from the building owners lue under the contract and gave the alone the right to give a good dis-

admitted by counsel for the contrac- t the assignment was an absolute nt and that the assignment was good, was contended that the arbitration as only part of the contract and not ly" but only a method for ascertain- um due, and they supported the first finding of the arbitrator. The Court held that the arbitration clause was a personal covenant which could not be transferred and which had not been transferred in this case. The arbitrator had jurisdiction to deal with the dispute, but in doing so it was his duty not merely to consider the terms of the contract within its limits but also its application and the enforcement of its terms having regard to the legal position of the parties Here the contractors had by their own act divested themselves of the right to claim the debt, and the building owners, not now being creditors of the contractors, could not give a good discharge for the debt.

We do not know whether, when the case is fully reported, more can be said, but at present all that can be done is to indicate the results of giving an absolute assignment "not purporting to be by way of charge only."

THE LANDLORD AND TENANT (No. 2) BILL

AS AMENDED IN COMMITTEE

THE Landlord and Tenant (No. 2) Bill is now again before Parliament, and it may be well to see how it stands as amended in Committee, as many of the clauses have been altered in wording and several new clauses have been added. In the first of our articles on this Bill (May 27) we commenced by trying to explain to what holdings Part I of the Bill would apply, and should our article have proved of any use we may say that no change has been effected in any of the clauses referred to in the first column, under the first heading, except mining leases were excluded, and premises used for professional purposes included; but the references to the clauses are now different. Clause 12, which shows what holdings Part I applies to, being now clause 16.

Compensation for Improvements.

In clause 1, subclause (1), "Tenant's right to compensation for improvements," any improvement is to include the erection of any building, but not trade or other fixtures, which the tenant is by law entitled to remove; these two provisions were added in Committee, otherwise the clause stands as it was. Then as regards the proviso which commences: "Provided that the sum to be paid as compensation shall not exceed," words have been added at the end of paragraph (*b*) which make it read as follows: "The reasonable cost of carrying out the improvement at the termination of the tenancy, subject to a deduction of an amount equal to the cost (if any) of putting the works constituting the improvement into a reasonable state of repair *except so far as such cost is covered by the liability of the tenant under any covenant or agreement as to the repair of the premises.*" We have italicised the words added.

The only other alteration in clause 1 is the addition of the words: "In the absence of agreement between the parties" at the commencement of sub-clause (3), which relates to the reference of questions as to the right to compensation to the tribunal.

Clause 2, "Limitation on tenant's right to compensation," has been a good deal amended, the only portions retained in their old form being subsection (1) (*a*), and what was subclause (2) which is now sub-clause (3), as three new paragraphs to sub-clause (1) and a new sub-clause have been added. Subclause (1) now reads: "A tenant shall not be entitled to compensation under this part of the Act (*a*) in respect of any improvement made before the commencement of this Act, or (*b*) in respect of any improvement which the tenant *or his predecessors in title were* under an obligation to make in pursuance of a contract entered into, *whether before or after the passing of this Act*, for valuable consideration, including a building lease." The words italicised are new. Then follow two new paragraphs, (*c*) in respect of any improvement made less than three years before the termination of the tenancy, or (*d*) if within one month after the making of the claim under section 1, subsection (1), of this Act the landlord serves on the tenant notice that he is willing to grant to the tenant a renewal of the tenancy at such rent and for such term as, failing agreement, the tribunal may consider reasonable; and if the tenant does not, within one month from the service of the notice, send to the landlord an acceptance in writing of the offer the tenant shall be deemed to have declined the offer." This provision in paragraph (*d*) follows in the main a provision contained in clause 4, subclause (1) (*b*), where compensation for goodwill is dealt with. Then follows the new subsection (2), which is as follows: "Where an offer of the renewal of a tenancy by the landlord under this section is accepted by the tenant, the rent fixed by the tribunal shall be the rent at which, in the opinion of the tribunal, a willing lessor would let the premises to a willing lessee, having regard to the terms of the lease, but irrespective of the value of the improvement in respect of which compensation would have been payable." That is to say, the value of the improvement effected by the tenant will not be taken into consideration.

Clause 3, "Landlord's right to object," has been amended as follows:—In subclause (1), when a tenant submits plans of a proposed improvement the plan must also show "that part of the existing building affected thereby." Then, if the landlord objects, and the tenant applies to the tribunal, the tribunal has to be satisfied "That notice of the tenant's intention to effect an improvement has been served upon any superior landlords interested, and, after giving such persons an opportunity of being heard," the tribunal may proceed as in the subclause provided. Clause 7 (in the original Bill clause 6) has been amended so as to permit of superior landlords appearing before the tribunal.

The proviso to clause 3, subclause (1), has been amended so as to remove a doubt we expressed in our first article. Where a landlord proves that he has offered to carry out the improvement himself in consideration of a reasonable increase in rent, now it is clearly stated the tribunal may fix the increased rent.

Subclause (2) is new and is rendered necessary by the amendment of subclause (1), enabling superior landlords to appear before the tribunal; it provides: "The tenant shall, at the request of any superior landlord, or at the request of the tribunal, supply such copies of the plans and specification of the proposed improvement as may be required."

Subclause (3), which provides that where there is no objection to a proposed improvement, or where it has been certified, it shall be lawful for the tenant to execute it, now contains a provision that it shall be executed "according to the plan and specification served on the landlord, or according to such plan and specification as modified by the tribunal, or by agreement," and a new proviso has been added to the subclause as follows: "Provided that nothing in this subsection shall authorise a tenant to execute an improvement in contravention of any restriction created or imposed (*a*) for naval, military, or air force purposes; (*b*) for civil

aviation purposes under the powers of the Air Navigation Act, 1920."

Subclause (4) has been amended by an important addition at the end of it. This subclause provides that a tenant shall not be entitled to claim compensation under this part of the Bill in respect of any improvement unless he has, or his predecessors in title have (these latter words having been added in Committee), given notice thereof under this section, and in case the landlord has given notice of objection thereto, the improvement has been certified by the tribunal to be a proper improvement. The clause in the original Bill stopped there, but now continues: "and the tenant has complied with the conditions, if any, imposed by the tribunal, nor unless the improvement is completed within such time after the service on the landlord of the notice of the proposed improvement as may be agreed between the tenant and the landlord or may be fixed by the tribunal."

Compensation for Goodwill.

Clause 4, which relates to compensation for goodwill, contains in subclause (1) two new paragraphs which appear to illustrate one of the complicated points under the Bill as drafted. The clause commences as before: "The tenant of a holding to which this part of this Act applies shall, if a claim for the purpose is made in the prescribed manner" (here follow the two new paragraphs) "(*a*) in the case of a tenancy from year to year, within one month of receiving the notice to quit, and (*b*) in the case of a tenancy for a term of years, not more than 36 nor less than 12 months before the termination of the tenancy" (then the paragraph reads as in the original Bill, with one addition we shall italicise) "be entitled at the termination of the tenancy on quitting the holding to compensation for goodwill if he proves to the satisfaction of the tribunal that by reason of the carrying on by him or his predecessors in title at the premises of a trade or business *for a period of not less than seven years* goodwill has become attached to the premises *which will* in the absence of arrangements to the contrary *be of pecuniary advantage* to the landlord."

This clause, like clause (1) relating to compensation for improvements, commences with the words: "The tenant of a holding to which this part of the Act applies," and in clause 16, subclause (1), it is laid down "The holdings to which this part of this Act applies are any premises held under a lease other than a mining lease, . . ." the latter exception having been added in Committee. The context of this part of the Bill would appear to imply that compensation for improvements or goodwill could hardly arise in connection with short agreements, but in the new paragraph (*a*) above we find tenancies from year to year now included. There is in Part III of the Bill, which is headed "General," a definition of the word "lease," but the definition clause (clause 24) commences: "For the purposes of this Act unless the context otherwise requires," and then "lease" is defined as "A lease, underlease, or other tenancy" (this word having been added in Committee) "assignment operating as a lease, or an agreement for such lease, underlease, tenancy, or assignment." If this definition applies to Part I, it appears that when the Legislature there speaks of a "lease" it really does not mean a lease in the ordinary acceptance of the word, but includes any "other tenancy." Short terms are very usually granted by agreements, and the point should be made clear whether the provisions in Part I of the Bill relating to compensation for improvements and goodwill are intended to apply to short-term agreements, and whether they apply to tenants holding over from year to year after the determination of the period of their tenancy. The tenancy mentioned in paragraph (*a*) from year to year might so arise. But for this new provision it might have been assumed that the clauses in Part I as to compensation for improvements and goodwill were confined to premises held under leases proper, the context excluding the general definition, and in our article of May 27 we made this assumption, but the Committee appear to have read the Bill otherwise and the point requires attention before the Bill becomes law.

The proviso to subclause (1), clause 4, paragraph (*a*), which relates to the sum to be awarded as compensation for goodwill, has been amended. The words "the capitalised value of such addition to the letting value" are omitted, and the words "such addition to the value of the holding" substituted, and the carrying on of business by the predecessors in title of the tenant are included, and at the end of the paragraph demolition of the building "wholly or partially" or user for a different purpose are to be taken into consideration in considering the value of the goodwill to the landlord. Paragraph (*b*) of the proviso has been amended as follows: where a claim is made by a tenant he shall not be entitled to compensation if within *two* months (the time was originally "one month") after making the claim, the landlord serves a notice that he is willing to grant the tenant a renewal of the tenancy *of the premises at which the trade or business is carried on at such rent and for such term not exceeding* 14 *years as failing agreement* the tribunal may consider reasonable. We have italicised the alterations, and there is no change in the rest of the paragraph (*b*), which stands as in the original Bill.

The following new paragraphs have been added to the proviso:—(*c*) In the case of licensed premises the compensation for goodwill shall not include any addition to the value of the premises attributable to the licence; (*d*) the tribunal in determining the compensation for goodwill shall have regard to the intentions of the tenant as to carrying on trade or business elsewhere; (*e*) compensation shall not be payable under this section if the tenant has determined the tenancy or failed to exercise an option for a further term contained in the lease or agreement; and (*f*) contains provisions as to Government Departments or local or public authorities or statutory or public utility companies.

Subclause (2) of clause 4 has been amended, the rent on an offer of renewal to be fixed by the tribunal now being the rent *at which* in the opinion of the tribunal *a willing lessee other than the tenant would agree to give and a willing lessor would agree to accept for the premises.* Otherwise the clause stands as in the original Bill.

A new subclause (3) has been added to the clause to bring it into line with clause 1, subclause (3), in relation to compensation for improvements, providing that in the absence of agreement between the parties all questions as to the right to compensation for goodwill and as to the amount thereof shall be determined by the tribunal.

We now come to what, as we anticipated in our former articles, would prove the most contentious clause in the Bill,

The Right to a New Lease.

Clause 5, subclause (1) has been redrafted and now is: "Where the tenant alleges that, though entitled to claim compensation under the last foregoing section, such compensation would not compensate him for the loss of goodwill if he removes to and carries on his trade or business in other premises, he may, in lieu of claiming such compensation, at any time within the period allowed for making a claim under the said section, serve on the landlord notice requiring a new lease of the premises at which the trade or business is carried on to be granted to him." It may first be noticed that the time-limits originally prescribed in clauses 4 and 5 within which a claim must be made have now been altered (see clause 4 (1) (*a*) and (*b*)).

Clause 5, subclause (1) as now amended removes one of the objections we raised to the Bill as originally drafted in our second article on June 3. We there pointed out that a double inquiry might be involved under the two clauses, but this objection has now been met by the introduction of the word lieu of claiming such compensation, is, compensation under clause 4.

Subsection (2) also contains imp alterations: Application to the tribu either the landlord or tenant must be not less than nine months before the te tion of the tenancy (in the original B time was three months), and now a l made on the period for which the t may order the grant of a new tena the term of years absolute must not 14 years, and the following provisi been added to the subclause: "But tribunal is precluded on any of the g mentioned in paragraph (*b*) of the fo subsection from making such an orc tribunal may award compensation un last foregoing section." Before refer the next clause we may mention th proviso to this subclause there is now vision as to the rent to be fixed whi much follows the lines of that in cl subclause (2) where a landlord offers lease in place of paying compensat improvements.

Subclause (3), paragraph (*a*) has ha amended to bring it into line with su (1) now that clause 5 only affords an tive remedy to that provided by cl The paragraph, which commences, " the tenant is the applicant, the gra new lease under this section shall deemed to be reasonable," these word unchanged, thus reads as follows: " the tenant proves that he is a suitable and that he is entitled to claim compe under the last foregoing section but th compensation would not compensate the loss he would suffer if he removed carried on his trade or business i premises." Then follows paragra which is referred to above in subcla which contains the grounds upon wh grant of the new lease shall not be reasonable on proof by the landlord tain facts set out in five paragraphs, of which only has been altered in Co That ground is "that the premises quired for occupation by himself or l or daughter of his over 18 years The Committee struck out "or by s son bona-fide residing with him." W allude to this provision without again ing the fact that the provisions of t Acts should find any place in a pe statute.

There is a proviso to this subsect if the tribunal refuses to grant a n on any of the grounds mentioned graph (*b*) the tribunal may make it tion of refusal that if the landlord fails out his intention within a period fixe tribunal, such compensation shall be the tribunal shall fix, but the words have been added: "not excee amount of the loss which the ten suffered by reason of having been of his right to the grant of a new lea this section."

Subclause (4) remains unchanged, follow two new clauses which illus difference in the attitude of the L where private landlords are concer where Government departments, public authorities, or statutory c utility companies are concerned.

As regards the private owner, (5) provides that every lease grant this section shall, if the landlord so be subject to a condition that if at after the expiration of seven years grant of the lease the premises are for the purpose of carrying out a s redevelopment the landlord, on the tribunal that the premises a quired, and on giving not less tha months' notice in writing to the ten determine the lease and resume pos the premises upon payment of such sation as the tribunal may determ the value of the unexpired resid term of the lease." This is surely provision that a lease granted unde sion after lasting seven years ca

ated by compensating the tenant for expired residue when the premises are d in connection with a scheme of re- ment.

ubclause (6), where Government de- nts and the other bodies mentioned are concerned, the position is very it, for there, where premises are not d immediately for their purposes but e required at some future time, the l shall not order the grant of a lease it is subject to a condition that the d may at any time on giving not less ix months' notice in writing resume ion of the premises. The Legislature ot appear to have learnt from the Rent hat, although all sorts of restrictions Act of Parliament be imposed on land- his is not beneficial in the long run nation, as it restricts supply and in ence enhances rents.

e following subclause—now (7), in the Bill (5)—there is no change except ertion of the words "failing agree- but subclause (8) is new, and may be a "snowball" clause. It provides claim for a new lease under this sec- ll arise in respect of goodwill attach- the premises and attributable to the r business carried on thereat during n of a new lease granted in pursuance section, without prejudice, however, ight to make a claim for compensation lause 4 in respect of goodwill created the term of a new lease. But for the n in the first portion of this clause ter could go on ad infinitum.

ncession to landlords has been made r subclause (12), which provides that lease under this section shall, if the so requires, contain a covenant pro- the carrying on of any trade or and the doing of any act prohibited original lease.

er new subclause (13) enables an order to be made by the tribunal roceedings under this clause cannot pleted before the termination of a owing to delay for which the tenant sponsible.

Alternative Accommodation.

mpletes this most highly controver- se, but a new clause has been added Bill (6) of some importance: "The nall not be entitled to compensation will under clause 4, nor to a new der clause 5, if, within one month e tenant has made a claim under subs (1), or served a notice under subcl. (1), the landlord serves on nt notice that he is willing to grant nant at such rent and for such term ribunal may consider reasonable, a of other premises which in the f the tribunal would reasonably to the tenant the goodwill of his The short period of time allowed uncertainty as to what the tribunal sider reasonable, will make this gatory.

General Provisions.

s6 in the original Bill, now clause 7, "of mesne landlords," is amended at by the insertion of the words "be to appear before the tribunal," and onal paragraph is added: "Where one landlord is concerned and they ree as to offer a renewal under (1) (*b*), in lieu of the payment for provided for in that section, the hall be empowered to decide which all be followed"—that, of course, whether compensation shall be for goodwill or the renewal of the granted.

pass over minor amendments made s7 to 12 as numbered in the original efer to three new clauses numbered mended Bill 13 to 15. Clause 13 s that where the powers of a landlord eases are subject to any statutory s he may, nevertheless, grant any as would relieve him under this part of the Bill from liability to pay compensation, also any lease he may be ordered to grant under this part of the Bill.

Clause 14 contains provisions relating to reversionary leases granted before the passing of this Bill enabling the rent to be adjusted in respect of compensation paid for improvements which have added to the letting value. Subclause (3) exempts landlords from payment of compensation for goodwill where before March 31, 1927, a reversionary lease has been granted or agreed to be granted commencing on or after the termination of a then existing tenancy.

Clause 15 is important. It provides that where a landlord is liable to pay any taxes (otherwise than by deduction from rent), or rates (including water rate), or the premiums of any fire insurance, and in consequence of any improvement executed by the tenant under this Bill the assessment of the premises or the rates of premium have been increased, the tenant shall be liable to pay to the landlord sums equal to the amount by which (*a*) the taxes or rates payable by the landlord are increased by reason of the increase in the assessment; (*b*) the increase in the fire premium and those sums are to be deemed to be rent and recoverable notwithstanding the Rent Restriction Acts.

This brings us to clause 16 (12 in the original Bill), and the only amendments introduced into that are the exclusion of mining leases and the inclusion of premises used for professional purposes as premises used for trade or business under this part of the Bill. This concludes Part I of the Bill, and we shall be able to refer to the remaining two parts of the Bill much more briefly in a second notice.

NEW BUILDINGS IN LONDON

Bermondsey. — REBUILDING. — Alterations and rebuilding work for new glue factory, etc., at 124, Grange-road, is being executed by Messrs. E. A. Roome and Co., Ltd., building contractors, of Hackney, under the supervision of Messrs. Geo. Elkington and Son, of Norfolk House, Laurence Pountney Hill, E.C.

Borough.—ALTERATIONS.—Extensive alterations and additions to factory premises are now being carried out at Layton's Buildings, Borough High-street, for Messrs. C. F. Westbury & Son, Ltd., under the supervision of Mr. H. W. Currey, L.R.I.B.A. Messrs. E. B. Holmes & Co., Ltd., of 155, Mare-street, E. 8, are the builders.

Bucklersbury.—ADDITIONS.—Messrs. Leslie and Co., of Kensington, are the builders for the new additions which are being added to the top floor of the National Safe Deposit's premises in Bucklersbury, E.C.4. Messrs. George and T. S. Vickerey, 50, Gresham-street, are the architects.

Bush Hill Park. — ALTERATIONS. — Messrs. E. B. Holmes & Co., Ltd., of Hackney, are carrying out extensive alterations and decorations for the Bush Hill Park Golf Club, Ltd., under the supervision of Mr. J. H. Somerset, architect.

Camberwell.—CHAPEL. — The Camberwell Borough Council has appointed Sir Aston Webb and Sons as architects for the new chapel and other buildings which are to be erected in the new cemetery for the Borough Council. The Council has also recommended Mr. H. H. Turner, of 19, Queen Anne's-gate, S.W.1, as quantity surveyor.

Camberwell. — GARAGES. — The London County Council has approved an application of Messrs. Murrell & Piggott, architects, for the formation or laying out of streets for carriage traffic to lead to garage buildings, and a garage and workshop building, upon a site at the rear of Grove Hill House, Grove Park, Camberwell.

Carshalton. — EXTENSIONS. — The Metropolitan Asylums Board have approved the finished sketch plans prepared by Messrs. Paine and Hobday, architects, for the extension of Queen Mary's Hospital for Children.

Euston-road. — PREMISES. — Messrs. Allen Fairhead & Sons, Ltd., of Enfield, have secured the contract for the erection of the new Euston-road weights and measures offices in Endsleigh Gardens, N.W.1, for the London County Council. The tender price is £23,500.

Finsbury.—REBUILDING.—"The Wilmington Arms" public house is being pulled down and rebuilt by Messrs. E. A. Roome and Co., Ltd., building contractors, of Hackney, for Messrs. Watney, Combe, Reid and Co., Ltd., under the supervision of Mr. G. G. Macfarlane, architect, Stag Brewery, Pimlico, S.W.1.

Hammersmith.—ADDITIONS.—The application submitted by Mr. A. G. Stedman, architect, 317, High Holborn, W.C.1, for the Demolition and Construction Co., for additions to 59a, Great Church-lane, Hammersmith, for the company, has been approved by the London County Council.

Stoke Newington. — OFFICE. — The local borough council has given consent to the erection of an office building upon a site adjoining 20, Manor-road. Messrs. Francis Dod & Co., estate agents, submitted the plans on behalf of Mr. F. Ward.

Strand. — EXTENSIONS. — The demolition work of 357, Strand, is now well in hand. The work is being carried by the St. Mary's Wharf Cartage Co., Ltd., and plans are being prepared by Mr. F. J. Wills for the new premises which are to be erected on the site, for Messrs. J. Lyons, of Kensington.

Wandsworth.—HOUSES.—Plans have been passed by the Wandsworth Borough Council for Messrs. John Laing and Son, Ltd., for erection of 100 houses in Khama-street, and in new roads leading out of Garratt-lane, on the Bell estate, Balham.

West Ham. — ADDITIONS. — Mr. J. H. Jacques, L.R.I.B.A., of 61, West Ham-lane, Stratford, E.15, has prepared plans for additions and alterations to the Upton Cross School, Plashet-road, Plaistow. Tenders are being invited by the West Ham E.C. for the work.

REVIEWS

BRITISH STANDARD GLOSSARY OF TERMS USED IN ELECTRICAL ENGINEERING. (London: Crosby, Lockwood & Son.) Price 5s. net.

This glossary is intended to cover the technical terms ordinarily used in electrical science and in its application to the electrical industry. In its preparation the objects have been to standardise and co-ordinate the electro-technical terms used in the British Empire and to provide a basis for the British portion of an international vocabulary, now in course of preparation by the International Electro-technical Commission. So as not to restrict their application unduly, an endeavour has been made to render the definitions as general as possible.

Craftsmen All. By DRYAD HANDICRAFTS (Leicester.) 4s. net.

"Some Readings in Praise of Making and Doing" is the sub-title of this book. To define it as a craftsman's anthology is to state a partial truth; it is an anthology for everyone who is interested in craft work. The charm of an anthology is one of the things a wise reviewer will not attempt to explain. Every reader has his favourites to which he returns again and again. There is a word of advice we would give. A collection of this nature carries with it a distinct fascinating flavour of the past, but craftsmanship lives on. The real object—or at least one of the objects of this collection—is to stimulate interest in the craftsmen of our own times, to carry on the English tradition. The contents include chapters upon Work and Life; Basket-making and Pottery; Weaving, Spinning and the Making of Cloth; Building; Metal-work; Writing and Printing; Painting and Wood-cuts; and Country Crafts. It is sufficient to say that the authors have spread a wide net and collected some choice specimens which will be treasured.

PUBLIC WORKS EXHIBITION

The Public Works, Roads and Transport Congress and Exhibition was opened at the Royal Agricultural Hall on Monday last. Sir Henry P. Maybury, K.C.M.G., Director-General, Roads Department, Ministry of Transport, in a speech at a Press luncheon said that nearly 2,000 delegates were attending the Congress meetings and seeing the exhibits. They came from the Dominions and from every country in Europe, and there were more delegates this year from local authorities than on any former occasion We in this country were spending forty-five millions a year on 287,000 miles of roads vested in 200 local authorities. Since 1920 we had built 200 miles of new arterial roads in the London area, and probably as much in the Provinces at a cost of thirty millions sterling. We had reconstructed 200 weak bridges and constructed many new ones. We were also building, among other works, a new bridge at Newcastle costing a quarter of a million of money, and a new one at Berwick. We had the finest highway engineers in the world, and it was only right that the finest education possible should be available. In this connection he hoped that the present Congress would see the establishment of a Chair of Highway Engineering at the University of London.

Below we give extracts from one of the papers read at the Congress, together with brief reports upon some of the more interesting exhibits. On Tuesday afternoon Mr. F. W. Goodenough, C.B.E., delivered a paper on "The Gas Industry's Contribution to Smoke Abatement." The lecturer said that it was well known that the cost of smoke to the community was enormous, and he believed it to be a moderate estimate to put at no less than £40,000,000 a year the total loss due to avoidable waste of fuel, damage to property of all kinds, loss of time through transport delays arising from smoke-fouled fogs, and similar evils traceable to smoke. The additional injury to health for which coal-smoke was responsible, whether by polluting the air we breathed or by depriving us of sunlight, was positively colossal, but could not be assessed. The facts were, however, too well established to admit of any doubt that a determined effort to reduce the smoke nuisance was the most urgent of all sanitary reforms of which this generation stood in need; while the economic importance of preventing smoke was perhaps sufficiently brought home by quoting the statement of the Coal Commission Report that in the coal mining industry "in effect the work of over a million men for three days every year is devoted to providing the soot which pollutes our atmosphere." And that was, of course, only one aspect of the waste which coal-smoke represented. The principal facts upon which it would be more profitable to concentrate attention were that some 40 million tons of coal a year were being consumed in a raw state for domestic purposes (including miners' coal), and that a rather greater amount—nearly 50 million tons—was the annual raw coal consumption of our manufacturing industries. The former of these was by far the more important in relation to the coal-smoke problem. Although the raw coal consumption of industry was higher than that of our homes, the accepted estimate was that five times as much soot was emitted by domestic as by industrial chimneys. The actual figures were 2½ million tons from the former, as against 500,000 tons from the latter. In addition to this, the smoke from domestic chimneys was, on the whole, more destructive than that for which industry was responsible. The reason was that coal is burned in domestic fireplaces at a much lower temperature than in the average industrial furnace, with the result that the smoke contained more tar, and so was stickier and more adhesive.

Domestic smoke was also entitled to claim our attention first for the further reason that it was immediately possible very substantially to reduce it. It had indeed already been enormously reduced, and it was important to be quite clear how. In 1912 the annual sootfall in London stood at about 75,000 tons. London was a good instance to take, because its smoke was very largely domestic, and it contained every class of residential area in about the right proportions to give a fair representation of housing and other relevant conditions throughout the country. By 1925 the annual sootfall in London had fallen to 35,000 tons—almost a 50 per cent. reduction in only 13 years. We might safely assume that the reduction of domestic smoke had been of a similar order over the whole country during the same period. But the curious fact emerged that, according to all the estimates, the domestic consumption of raw coal during these same years had remained almost stationary, or had dropped at most by 2 or 3 per cent. It was worth noticing in passing that even a stationary consumption of raw coal was evidence of headway: during these years in question the population had not only increased by three millions, but had, on the average, tended to enjoy a higher standard of living. This necessarily meant an increased fuel consumption, which had evidently been met by other fuels than coal. From the smoke abatement point of view, this was a gratifying fact. But what was the explanation of a stationary coal consumption and a simultaneous reduction of nearly 50 per cent. in smoke? The answers were several. In the first place, it might be admitted that the smoke reduction was not quite as great as sootfall figures show. The improvement had taken place at a time which corresponded with a period of better town-planning and suburban development. The population had been spread more and more round the outskirts of towns, and there were now, on the average, fewer houses to the urban acre. This would account for a proportionately lower sootfall on any given acre, or at any particular soot gauge, even if the raw coal consumption and domestic smoke emission of the whole country remained the same.

Secondly, some credit for the reduction of smoke was certainly due to the improved designs of solid fuel grates commonly installed in new houses. On the average, domestic coal fires caused rather less smoke than in the past. Thirdly, there was the most important fact that the average ash content of domestic coal had increased since before the War by something like 15 per cent. In other words, the raw coal consumption to-day represented 15 per cent. less fuel than the equal consumption, by weight, of 15 years ago. Fourthly, it could readily be shown that the headway made by gas had been to a far greater extent at the expense of coal-fired kitcheners than of domestic coal fires. Such were the explanations of the apparent paradox of a stationary coal consumption and a simultaneous reduction in smoke; and such was the vindication of the claim that the progress of gas had been the chief factor in reducing it.

Stand 75. G. H. Blakemore, 180, Piccadilly, W.1.—The exhibit consists of various petrol-driven plant, air-compressing, trench-pumping, etc., together with a selection of tipping trailers, tip-carts, barrows, etc. The specification of the "Super" portable petrol-driven, air-compressor plant is:—Air-compressor unit, petrol engine, radiator, air receiver, etc., the whole mounted on steel chassis and enclosed in steel lock-up housing. Driven by 25-h.p. petrol engine. Air-compressor of the vertical duplex-cylinder having a piston displacement of 121 cub of free air per minute.

Stand 22. British Reinforced Co Engineering Co., Ltd., Stafford.—The consists of a display of photographic e ments of various types of roads, among the new Piccadilly, in which B.R.C. has been used, viz.: reinforced concre faced roads, reinforced concrete road tions, reinforced concrete tramtrack tions and reinforced tarmacadam roa addition to these are various models s different types of road reinforcement. new B.R.C. films showing reinforced c surfaced roads which have been traffic for not less than five years, shown to surveyors on request.

Stand 83. The British Steel Pilin Ltd., 54a, Parliament-street, S.W.1. company is showing a steel pile fram mechanically operated raking gear, eq with Zenith double-drum friction win boiler and No. 6 McKiernan-Terry hammer. A specimen of "Vibro *in situ* concrete pile, which was made ground and afterwards extracted, is view.

Stand 210. Broad & Co., Ltd., 4, Wharf, London, W.2.—A selection firm's manhole covers are shown, inc Broad's "Agripper" cover, which, been claimed, has successfully overco rocking nuisance. It is a sound and sc piece of workmanship, and the effectiv plicity and ingenuity of the "Agri patent seating should make a strong to all surveyors and road cover users

Stand 67. Brookes, Ltd., Halifax, —The products of this company, stone, and other materials for roadwa buildings, are on view here, includin stones, and the well-known "Nonslip for paving and architectural work. T ducts of the Brookes' numerous ass companies—pipes and firebricks, tarm and heavy chemicals, etc.—are also o

Stand 144. A. A. Byrd & Co., 11, Victoria-street, E.C.4.—Samples of t known Metaform steel-shuttering for construction are shown here, illu the straight and circular types for concrete wall construction, and a models of the Kwik-Mix tilting drum mixers and Koehring street paving representing modern equipment for road construction. An invention also demonstrated on the stand of A. A. Byrd and Co., and one whi great interest to all concrete users, Koehring Company's "Batch Meter" device ensures a proper mix, and adjusted to any desired length of tim batch cannot be released until a bel and the meter-box cannot be opened by the person who has the key. It seen, therefore, that a check is provi only upon mix, but also upon outp the invention is one therefore that for scientifically accurate concrete well as being calculated to speed up tion.

Messrs. Byrd are, in addition, s cessionaires for Great Britain and I Tricosal SIII, a new medium for is claimed that it makes ordinary ce rapidly in any desired time, giving i strength. We understand that shortens the period of final settin 8 minutes, with great final strength ness of the cement. One of its us stopping leaks against water press we gather that it is being extensiv where waterbursts have to be p quickly as possible, without cuttin pressure.

Stand 42. Carbic, Ltd., 51, viaduct, E.C.1.—The many uses of in modern engineering practice are known that great interest will be a the novel merits of the Carbic s acetylene production, and its appl

ds of lighting purposes, as well as in ion with oxy-acetylene welding and . We gather that Carbic generators n a simple principle based on natural rith the result that acetylene is auto- ly passed to the burner only as re- at a regular pressure and an extremely mperature. Efficiency and working y follow as a sequel. Complete ranges rators for all purposes are shown, and ous demonstrations of oxy-acetylene and cutting of all kinds—including ting of cast-iron—are given.

166. Celotex Company of Great Ltd., 323-6, Australia House, W.C.2. firm, and their wholesale distributors gland, Wales, and Ireland, the Mer- Trading Company, Ltd., are exhibit- pavilion which demonstrates the uses otex for all kinds of structural insula- ork. It is water-proof, vermin-proof, ically sterilised and inherently durable. llowing are among its main uses : old, and damp-proof lining for walls eilings; sound-deadening; acoustical ion; roof insulation; and shuttering red concrete. This exhibit is interest- cause it displays full-size wall, floor, and roof sections.

82. Cement Marketing Co., Ltd., d House, Tothill-street, S.W.1.—This demonstrates the uses and value of Circle " Portland cement and " Ferro- the rapid-hardening Portland cement. st some of the uses are seen a section nent-grouted road, various types of slabs, kerbs, channels, catchpits, cul- fencing, direction posts, lamp posts, tiles, bricks, and sections of concrete courts. There will also be various ex- of cast-stone, one of which will be a of balustrading such as is used for .

71. Colas Products, Ltd., and Cold Mix, Ltd., 38-39, Parliament- S.W.1.—The stand comprises an exten- hibit, in which there will be a great interest the road engineer. In addi- the many interesting exhibits on the art of the stand, a number of samples, raphs and diagrams are to be found in furnished offices at the rear of the The main theme of the display is to trate the best method of obtaining a and lasting surface at the smallest cost, and the durability, non-slipperi- d the general simplicity of the Colas e convincingly displayed. Other ex- f interest will include samples taken oads that have been surfaced with te, which is a pure asphaltic concrete mixed and laid cold.

72. The Expanded Metal Co., Ltd., Mansion, Petty France, S.W.1.—The consists of samples of the company's products: photographs of a few of the portant municipal works carried out stems. Products displayed include :— net " RR reinforcement for concrete etc.; " Expamet " expanded steel- einforcement for concrete, which has ed extensively over 30 years for ons, floors, roofs, bridges, culverts, Expamet " and " BB " lathing for ork, etc.

39. Goodwin, Barsby & Co., Ltd., rgaret's Ironworks, Leicester.—A " No. 3 patent bituminous macadam displayed here. This outfit comprises long by 3 ft. dia. dryer of the " design, provided with balanced and cyclone dust collector, and g and loading skip, and a ½-yd. n double shaft paddle mixer. The r outfit exhibited has also a feeding to the dryer of the dredger type, strong malleable buckets mounted on The outfit can be supplied without tor if so desired. Several concrete- f the open-drum portable type, fitted Lister " petrol engines, are also on

Stand 59. Improved Wood Pavement Co., Ltd., Blackfriars House, New Bridge-street, E.C.4.—This exhibit comprises samples of wood paving and wood-block flooring, together with photographs of important contracts carried out by the company in many large cities.

Stand 141. Johnson's Reinforced Concrete Engineering Co., Ltd., 47, Victoria-street, S.W.1.—This old-established company is again exhibiting its specialities known as Johnson's steel-wire lattice reinforcement for floors, roofs, decks, and the like; " Keedon " reinforcement for beams and columns, and " Brick- tor " reinforcement for brick walls. The business is divided into three sections, known as the Designing Department, which deals with all the detail designs on a designing basis to collaborate with architects and engineers; the Material Section; and the Contracting Department.

Stand 143. Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., 136, High Holborn, W.C.1.—This firm is making a special display of its " Duromit," a surface material, composed of imperishable crystals and crystalloids, second only in hardness, it is claimed, to diamonds for wear-resisting qualities. It is free from dust, is waterproof, and non-slippery. " Duromit," we understand, can be laid by the company or by any expert cement floor-layer.

Stand 138. Langley London, Ltd., The Courtrai-Du Nord Tile Co., Ltd., 161, Borough High-street, S.E.1.—The stand of " The Tile People in the Boro' " is a pavilion with a four-hipped roof, covered with Courtrai-Du Nord Tiles, and is enclosed by display counters. Sections of roofs covered with Marseilles, Beauvais and Courtrai-Du Nord tiles are exhibited, while the Gilardoni roofing tiles of ever-growing popularity are shown to great advantage. The company is exhibiting for the first time the Porphyry concrete paving slabs.

Stand 232. Lewisham Timber Co., Ltd., Lewisham Bridge, S.E.13.—This exhibit conveys an idea of the quality and workmanship of the company's products. The few examples of fencings shown are types in most popular demand. Special designs, to specification, can be carried out. Plant, such as tool boxes, road boards, trestles, etc., examples of which are on exhibition, come within the scope of the company's activities.

Stand 65. Limmer and Trinidad Lake Asphalt Co., Ltd., 34, Victoria-street, S.W.1.—The stand comprises exhibits connected with bituminous road construction, the specifications of which this company standardised early in the century, and have ever since followed with success. These specifications have been altered somewhat to suit modern traffic conditions, and the latest information will be available both by demonstration and samples. Engineers interested in building constructional work will be able to inspect the latest applications of Trinidad mastic asphalt. The featuring of the analytical side of bituminous road construction is in the hands of Hutchinson's Testing Apparatus, Ltd., whose latest instruments for the correct estimation of ductility will be seen in operation.

Stand 1. R. A. Lister & Co., Ltd., Dinsley, Gloucestershire.—A number of this firm's " Lister " auto-trucks are displayed here. Petrol-driven, they are claimed to be the most economical vehicles of their class on the market. Features are that they reverse without the aid of gearing, as the engine and steering unit merely swing round on their frame, and the fact that the truck can be turned in a radius less than its own length. A display is made also of the 4-stroke " Lister " petrol-engines, which are automatically lubricated throughout.

Stand 188. London Valve Co., Ltd., 122, Colmore-row, Birmingham. London Office, 23, Norfolk street, W.C. 2. — A display is given of the new " Washer-less " water taps, which have neither washers nor seatings. These taps in no way depend upon the screw-down load as applied by hand, but make use of water pressure in overcoming leakage. The display of goods also includes many types of ordinary brass, plated, and galvanised water taps having the above feature; but in addition are shown porcelain taps having no exposed metal parts, and these also have the washerless feature.

Stand 76. Marshall, Sons & Co., Ltd., Britannia Ironworks, Gainsborough, Lincs.—This display comprises a group of " Marshall " road rollers and road equipment, including :— 6-ton tandem road roller; 10-ton single-cylinder road roller; 16-brake h.p. class SP portable crude oil engine, with self starter, etc.; 6/9 concrete mixer; 3/4 concrete mixer; 4-ton asphalt plant; and the " Universal " road roller.

Stand 81. Millars' Machinery Co., Ltd., Pinner's Hall, E.C.2.—A good display of asphalt plant and concrete mixers are on view here, together with the " Tructractor "—a combined truck and tractor with a capacity of 2-tons load and 16-20-tons haulage—pumps of various descriptions, and carts. Millars' 10-tons portable asphalt plant are modern in design and economical and efficient to a remarkable degree. They incorporate a comprehensive weighing apparatus, providing for each constituent of the mixture, and visible to the operator, while they combine perfect drying, exact heating, and the practical elimination of radiation losses.

Stand 89. Frederick Parker, Ltd., Viaduct Works, Leicester.—A good selection of " Parker " plant is displayed here, such as mixers, granulators, crushers, tar-macadam plant, barrows, etc. We learn that one " Parker " O.C. mixer of 7 cubic feet unmixed material per batch is capable of 50 cubic yards of thoroughly mixed concrete per day. The machine is equipped with automatic loading and measuring hopper, and automatic regulating water tank, whilst the machine is mounted on four wheels with front swivelling fore carriage and drawbar. Power is provided by 3½ b.h.p. " Lister " engine.

Stand 12. Parker, Winder & Achurch, Ltd., Broad-street, Birmingham.—This firm, who specialise in concrete mixers and moulding plant, are showing several of their types of plant, both hand- and power-driven, a speciality being made of their " Parwinac " mixer—a portable machine of 3-4 cubic feet capacity—fitted with a " Lister " petrol engine. On show also are their " Excelsior " patent steel-bladed screens, rotary screens for operation by hand and power, and their screening panels, suitable for incorporation with existing plant.

Stand 115. Petters, Ltd., Ipswich and Yeovil; London Office: 75b, Queen Victoria-street, E.C.4.—The Ipswich Works exhibit comprises a heavy-oil pumping set, capable of developing 75 b.h.p., direct-coupled to a Mather & Platt " Medivane " medium-lift pump. The outstanding features of the Petter " C " type two-stroke engine are its great simplicity and comparatively low working pressure. The Yeovil Works' exhibit includes a 12/14 b.h.p. portable, horizontal "S" type Petter oil engine, working on crude oil or kerosene. This engine starts instantly from cold by means of the patent cold-starter, in which is used the same fuel as is used for running. It is a medium-compression engine of the surface-ignition type, and is useful for working on building estates, public works, etc.

Stand 23. Phœnix Engineering Co., Ltd., Phœnix Works, Chard, Somerset.—Numerous examples of this firm's patent bitumen spraying machines are on view here, including " Phœnix Extra-rapid," whose capacity is 60 gallons. It is fitted with a powerful double-acting spraying pump, the suction of which is controlled by a valve of special design, embodied in the base of the pump and so arranged that one movement changes from " Work " to " Hot Air," and *vice versa*. The machine is complete with jib crane for

lifting barrels and drums, flexible hose, scythe pipe, and specially constructed nozzle. This machine may also be arranged for grouting only, if desired.

Stand 165. Portland Cement Selling and Distributing Co., Ltd., 20, Buckingham-gate, S.W.1.—The "Red Triangle" brands of Cement and the "Red Triangle" Service are the particular matter for exhibition of the Portland Cement Selling and Distributing Company on this stand. A special feature will be made of Vitocrete, the new rapid hardening cement, which is, we learn, being specified very widely. The company make a special feature of delivering their cement in the 4-ply 1-cwt. paper bags. Photographs are on view showing the various contracts that have been carried out with the ordinary cement, and also those carried out with Vitocrete. A testing machine is being daily operated.

Stand 15. Rawlplug Co., Ltd., Rawlplug House, Cromwell-road, S.W.7.—Demonstrations in the use of Rawlplugs are given throughout the day on this stand. A new invention is also being shown, the Rawlplug pipe and conduit clip. The clip offers unusual strength, due to the screw or nail used for fixing purposes pulling directly on the edge of the strap. Rawlplug rotary wall-drills are another invention, being ideal for making holes in tiles, glass, brick, and generally in all building materials, except those having grit in their composition.

Stand 92. Robey & Co., Ltd., Lincoln.—Steam wagons, steam and petrol rollers comprise this interesting exhibit. The "Robey" 7-ton steam roller with tandem rolls and instantaneous reverse, as already supplied to some of the leading road construction companies and many of the public authorities in this country and abroad, is among these exhibits. We are given to understand that its compound engine ensures the greatest possible economy in fuel and water, and its special piston valve and link motion reverse gear ensures that smooth backward and forward working that is essential to the proper laying of a modern asphalt road.

Stand 9. Tangyes, Ltd., Cornwall Works, Birmingham.—A selection of Tangye heavy fuel engines are now on view, together with several "Tan-Gyro" centrifugal pumps and ram pumps of various types and sizes, several being specially suitable for dealing with small quantities of water required for farm and housing estate work. A selection of Tangye lifting tackle, consisting of pulley blocks, screw and hydraulic lifting jacks are also displayed, together with a number of malleable castings.

Stand 181. Triangular Construction Co., Ltd., Imber-court, East Molesey, Surrey.—This firm has a comprehensive exhibit of various building construction methods and shuttering, etc.; also of materials. Demonstrations are given of the Triangular system of construction. Sections of walling (full size) are shown, demonstrating the use of an impervious material on the external face, and a porous material on the interior face, with perfect diagonal bonding, and continuous vertical cavities. The Triangular system will also be shown for the first time in various kinds of artificial stone finish for the exterior.

Stand 46. Tuke & Bell, Ltd., Carlton Engineering Works, Lichfield, Staffs; London Office: 27, Lincoln's Inn-fields, W.C.2.—The range of road machines exhibited by this company include a "Morris" 30-cwt. chassis, fitted with 2-seater cab, plate-glass windscreen, cab side doors, and patent dual purpose body; 120 cubic feet capacity for house refuse, 51 cubic feet capacity for general purpose haulage work; the top portion is easily removable when not required. The lorry is fitted with patent gravity hand-operated end-tipping gear, while a patent road gritting attachment is fitted to the lorry for speedily and economically treating slippery roads when required.

Stand 87. Winget (1924), Ltd., Winget House, Grosvenor-gardens, S.W.1.—The outstanding features of the "Winget" stand are the latest models of the open-drum mixer with the Burn-Lancaster patent drum, by means of which this firm, which celebrates its coming-of-age during the present year, claims to have solved the problem of the perfect concrete mix. No separation of the materials, we understand, can possibly take place in this machine, no matter how long the mixing is allowed to continue. Besides this range of mixers, Messrs. Winget are exhibiting several types of their block- and slab-making machines.

Brick Manufacturer's Estate.

Mr. Alexander Yeats Jones, of Studland, Gosforth, Northumberland, brick manufacturer, of Messrs. Jones Bros., formerly of Netherheys, Gosforth (net personalty £33,219), left £34,029.

Shakespeare Memorial Theatre.

The *Daily Telegraph* has announced that the fund for the rebuilding of the Shakespeare Memorial Theatre at Stratford-on-Avon, initiated last year by a letter signed by the Prime Minister, Mr. MacDonald, Lord Oxford, and Mr. Thomas Hardy, has now reached £230,818.

Town-Planning Progress.

The following statement of town-planning progress in England and Wales for the month ended October 31, 1927, is issued by the Town-Planning Department of the Ministry of Health:—

Preliminary statement approved Stage BB).

Devonshire: Exeter T.C.

Preliminary statements submitted (Stage B).

Middlesex: Staines R.D.C.

Surrey: Epsom R.D.C. (Ewell and Cuddington).

Resolutions received (Stage H).

Cheshire: Alderley Edge U.D.C.

Yorkshire (West Riding): Sheffield T.C. (N.W. addition); Sheffield T.C. (N.E. addition).

Yorkshire: York T.C. (No. 5).

Lancashire: Liverpool T.C. (No. 2); Whiston R.D.C. (Liverpool T.C. (No. 2)).

Yorkshire (East Riding): Escrick R.D.C. (York T.C. (No. 5)).

Housing Subsidy Reduction.

We take the following extracts from the *Local Government Journal*:—

No subject has been more closely canvassed in local government circles than the probable effect of the reduction of the Government subsidy in respect of houses not completed before October 1 last. It has been claimed that the reduction would lead to a fall in building prices and would in no way check the rate of production. That was the official view of the Ministry of Health, but it has been questioned by other competent authorities.

Statistics as to the average price of houses included in contracts let by, or in direct labour schemes of, local authorities are, for a variety of reasons, unreliable guides unless checked by fuller information from original sources. Information was obtained from about one hundred representative municipal corporations and urban district councils in England and Wales in response to the following inquiry:—Have building prices fallen in your district in consequence of the reduced subsidy?

In response to this inquiry (excluding those local authorities who for one reason or another—generally because no building had taken place since the reduction of the subsidy—were unable to furnish information) 19 local authorities replied that building prices had fallen in their district in consequence of the reduced subsidy; 22 replied that prices had fallen but stated either that the reason was doubtful or that the fall was definitely attributable to other causes than the reduced subsidy; and 37 replied that prices had not fallen in consequence of the reduced subsidy.

Only 19 out of 78, therefore, reported a fall in prices attributable to the reduced subsidy.

NEW COMPANIES

The particulars quoted below have compiled by Messrs. Jordan & Sons, Company Registration Agents, of 116 & Chancery-lane, W.C.2, from the docum available at the Companies' Registry.

W. E. GREENWOOD & SON, LTD. (224 Registered September 2. Mordaunt-Harlesden, N.W.10. Builders and co tors, etc. Nominal capital, £5,000.

PERCY J. TURNER (IPSWICH), (224121). Registered August 31. W street, Ipswich. Builder and contr Nominal capital, £2,500.

MIDDLETON & KEENE, LTD. (224,118). tered August 31. Hill Brow, Liss, H Civil Engineering and General Contra etc. Nominal capital, £2,000.

THOMAS MITCHELL & SONS (GUILDF LTD. (224,123). Registered August 31. and tile manufacturers. Nominal ca £20,000.

R. W. SCOTT & CO., LTD. (224,228). tered September 5. Roker Joinery W Harbour View, Sunderland. Builders contractors. Nominal capital, £1,000.

HARRY MILLOTT & SONS, LTD. (224 Registered September 5. Painter and rator. Nominal capital, £1,000.

CHAPPELL & COMPANY (MAJOR MATTH LTD. (224,205). Registered Septemb 45, London Wall, E.C. 2. Builders, co tors and sanitary engineers, etc. No capital, £100.

B. HAWLEY & COMPANY, LTD. (224 Registered September 1. Builder and tractor. Nominal capital, £6,000.

DAVID THOMSON & SONS, LTD. (224 Registered September 14. Public plumbers', electrical and consulting engi etc., 1, Barwise-court, Carlisle. N capital, £25,000.

DERBYSHIRE HYDRATED LIME CO.. (224,407.) Registered September 14. Pelham-street, Nottingham. Dealer lime, lime products, etc. Nominal c £700.

R. WRAGG & SON, LTD. (224,445.) tered September 15. Builders' mercha slater. Nominal capital, £3,000.

MOTIFS, LTD. (224,443.) Registered tember 15. Builders and contractors Nominal capital, £100.

WARRINER & SONS, LTD. (224,479.) tered September 16. 190, Bishopsgate, Builders' contractors and cabinet-make Nominal capital, £100.

INTERNATIONAL CONTRACTS, LTD. (22 Registered September 16. 10, Lan place, W.C.2. Builders, contractors, neers and estate agents, etc. Nomina tal, £5,000.

CROYDON MEMORIAL CO., LTD. (22 Registered September 16. Mitchan Croydon. Monumental stone maso sculptors, etc. Nominal capital, £150.

ASSOCIATED FACING BRICK & TILE V LTD. (224,426.) Registered Septem 3 & 4, Lothbury, E.C.2. Brick a makers. Nominal capital, £127,750.

COOKE BROS., LTD. (224,497.) Reg September 17. Builders, contractor engineers, 20, Northbrook-street, Ne Nominal capital, £4,000.

H. POLLARD, LTD. (224,433.) Reg September 15. Builders and gener tractors, etc. Nominal capital, £4,00

ANGLO-DUTCH BRICK CO. (1927). (224,354.) Registered September 12 Victoria-street, S.W.1. Nominal £500.

BELL ESTATES, LTD. (224,326). tered September 10. Brent-street, F N.W.4. Estate developers; builder Nominal capital, £12,000.

WELLBUILT, LTD. (224,341.) Reg September 10. 1, Goring-road, Bowe N.11. Builders and house decorato Nominal capital, £1,000.

HAMILTON SLABS, LTD. (224,379). tered September 12. 233, Clapha S.W.9. Manufacturers of concrete cement partition slabs, etc. Nominal £100.

RATES OF WAGES IN THE BUILDING TRADE

For rates of wages in the Building Trade in Scotland see page 799.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed, that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, etc., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

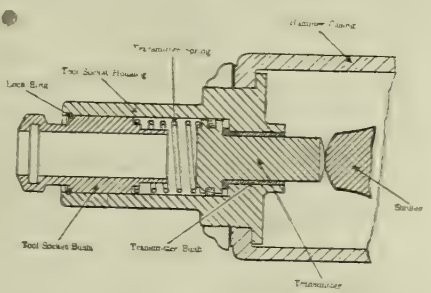
bley.—A swimming bath for Wembley is od.

Bromwich.—T.C. are to apply to M.H. for to borrow £60,550 for Swan Village im-ent scheme.

TRADE NEWS



Kingston By-pass Road.

In connection with the recent opening by the Premier of the Kingston by-pass road, we learn that the ¾ in. washed crushed river ballast and washed river sand used in the construction of the bridges built by Messrs. Christiani & Nielsen and Holloway Bros. (London), Ltd., was supplied by Messrs. William Boyer & Sons, Ltd., of Irongate Wharf, Paddington Basin, W.

An Electro-Mechanical Hammer.

We have had an opportunity of inspecting the new-pattern "Kango" electro-mechanical hammer, which is put on the market by the Kango Co., Ltd., of 78, Petty France, S.W.1. This hammer, which is of the light chipping, caulking and scaling type, weighs only 9½ lb., and has a very low current consumption of roughly 300 watts. As a general utility tool, it is designed for direct connection to existing lighting circuits, and is provided with a high efficiency universally wound motor suitable for either A.C. or D.C. current.

Standard motors are wound for currents most frequently met with, which are generally of 110, 200 or 220 volts, but by the aid of suitably calibrated resistance, which can be supplied when necessary, any intermediate voltages from 110 to 250 volts can

Construction of the "Kango" Hammer.

be conveniently used. The hammer may also be run from a portable "Lister" engine which enables it to be used on country jobs. Features of the new pattern of "Kango" hammer are an ingenious device which eliminates all shattering and percussion, while a new type of switch has been incorporated making for greater efficiency and length of use. By the mere extraction of one tool from the tool-socket—which can be readily adjusted to take any tool with a shank of ⅝ in. downwards—the hammer can be put to any one of a number of uses, as chipping steel, trimming castings, panel beating, boiler scaling; carving, chiselling, shaping wood or composition; cutting, dressing, drilling, chasing, carving stone, brickwork or concrete. We have ourselves tested this hammer, and are of the opinion that it may well prove very useful to the builder and contractor, while its adaptability to the fitting of wall plugs is likely to be of value to the decorator

American Fittings.

We are informed that the firm of Sir S. W. Royse & Co., Ltd., of 20, Albert-square, Manchester, have come to an arrangement with the Duriron Company, Inc., of Dayton, Ohio, to represent their valves, fans, steam jets, pumps, pipes, etc., in the U.K. and Ireland. The Duriron Company, we learn, have specialised for many years in the manufacture of metals very highly resistant to acids and other corrosives.

An Industrial Wiring System.

The Macintosh Cable Company, Ltd., of St. James's House, S.W.1, describe a newly introduced industrial wiring system in a booklet recently issued by them. This system, we gather, has been introduced to fill a need for a simple method of wiring factories and buildings, where destructive atmospheric conditions prevail. These conditions are met by the applications not only to the cables and wires but also to the fittings of "Maconite," which gives, we understand, complete protection. Details will be gladly furnished upon request to the company.

A Correction.

We desire to draw attention to an erroneous statement contained in the announcement of Messrs. Cowan, Hulbert, Ltd., of Abbey House, Victoria-street, Westminster, S.W.1, in last week's issue. It was stated that the number of Self-Lock Adjustable Rooshors in use in the London area was over 1,000. This should, of course, have been 10,000.

The Larkhall Estate, Clapham.

In connection with our illustrations and description of Messrs. Louis de Soissons and G. G. Wornum's work at this estate, given in our last issue, we learn that the facing bricks used in obtaining the attractive appearance of the exterior were supplied by Messrs. R. G. Ward & Co., Ltd., of 5, Laurence Pountney Hill, E.C.4.

Moulding and Planing Machines.

A new booklet on this subject has been issued by Messrs. Thomas Robinson & Sons, Ltd., of Railway Works, Rochdale, which sets out in attractive manner the various features of the design and construction. Special points regarding this firm's machines are, we are told, the ball bearings which are used wherever possible, absence of vibration, an ample reserve of "belt-power" (useful when taking a heavy cut), and plenty of purchase in the gearing of the feed-rollers. The booklet may be obtained upon application.

The Tomb of Edmund de Langley, King's Langley.

The Cassio Press have produced a little booklet dealing with the historic monuments, tablets, and brasses in King's Langley Parish Church, and especially with "The Romantic Life of Edmund de Langley and His Notable Tomb," under which title the Rev. John Parker Haythornthwaite—vicar of the parish—has published the book. It is likely to prove of interest to antiquarians and members of the general public visiting King's Langley.

Institute of Municipal and County Engineers: New President.

Mr. A. Dryland, the County Surveyor of Middlesex, has been nominated as president of the Institution of Municipal and County Engineers for the year 1928-1929.

Improvements in Pall Mall.

Westminster City Council have adopted without discussion a recommendation from the Improvements Committee regarding a proposal to set back the approach to Marlborough House in order to effect an improvement in the traffic conditions at the junction of Pall Mall and St. James's-street. The total cost is estimated at £5,300.

The Preservation of Cottage Architecture.

Sir Frank Baines, speaking on "The Preservation of the Cottage Architecture of this Country" in London recently, urged men in industry and commerce to support the movement recently inaugurated at the Royal Society of Arts by an appeal signed and prepared by the Prime Minister. The Government had made it clear that they could not extend the Ancient Monuments Act of 1913 to cottage architecture, and he thought the people themselves should see that this part of our history was not lost.

Salford Exhibition Hall.

Work on the scheme for providing Salford with an exhibition hall and an amusement park at a final cost estimated at £1,000,000 will begin early next year, says the *Yorkshire Post*. The site is the old cattle market with over 10½ acres, and it is claimed the hall will be the largest in the world. The new building will have 143,750 square feet without pillars or other obstructions. Its height will be over 100 feet. The roof is to be arched, and it is stated it will have the largest single-span roof in the world, namely, 230 feet. Mr. Robert Atkinson, F.R.I.B.A., and Sir Owen Williams, have prepared the plans.

PRICES CURRENT OF MATERIALS.*

[Owing to the exceptional circumstances which prevail at the present time, prices of materials should be confirmed by inquiry.]

THE SCOTTISH BUILDER

DOMESTIC USES OF ELECTRICITY

A lecture arranged in conjunction with the British Electrical Development Association was delivered recently to the staff and students of the Aberdeen School of Domestic Science by Mr. L. Edwards, A.M.I.E.E. The subject of the lecture was "Domestic Electrical Appliances," and the lecturer dealt with the various ways in which electricity can add to comfort and save labour. He also dealt with the tonic effect of ultra-violet rays, which can be produced in special lamps suitable for home use. The cost of running various appliances was considered, and demonstrations of electric fires, electric water heaters, and an electric refrigerator were given. The lecture was illustrated by lantern slides.

NEW BUILDINGS IN SCOTLAND

Dundee.—CINEMA.—Plans are being prepared by Messrs. Allen & Frisken, of 26, Castle-street, for the new cinema which is to be erected in Arthurstone-terrace.

Saltcoats.—HOUSES.—Tenders are being invited by the Town Council for the erection of forty-eight houses. Mr. T. Thomson, of 60, Hamilton-street, is the architect.

Fife.—REBUILDING.—The Fife Education Authority have accepted a recommendation of the Primary Education Committee providing for the reconstruction of ten classrooms at the Crosshill site to replace the previous structure, which was destroyed by fire, and the provision of an annexe, consisting of four classrooms and playroom at Ballingry School for an infant department.

Musselburgh.—SCHOOLS. — The Midlothian Education Authority have approved a report on school accommodation in Musselburgh recommending a scheme for alterations to various schools, at an estimated cost of about £39,000.

Dundee.—CHURCH.—A sum of £14,000 will be needed to build the proposed new church in Byron-street, Dundee.

Edinburgh. — BUILDING. — The following plans have been passed by the Dean of Guild Court :—Mrs. Jessie T. Bain — six flatted villas at Trinity-road; Mrs. Elizabeth Cochrane—two shops at corner of Lochend-road and Lochend-avenue; Mr. J. Miller—eight double bungalows at Orchard-drive, three at Orchard-terrace, and two at Craigleith-road.

Glasgow.—BUILDINGS.—The Dean of Guild Court has approved the following plans :—Mr. R. S. Gilmour—eleven terrace houses and lane at Kilmarnock-road, Newlands; Emmanuel Mission—hall at 305, Scotland-street; Glasgow Greyhound Racecourse (Limited)—greyhound track and stands at Paisley-road West; Parks Department—bowling pavilion at Holmhead-road; Housing Department—shops at Ellesmere-street, Hamiltonhill; Western Heritable Investment Co. (Ltd.)—700 houses and to form streets at Meikle Aikenhead.

Moray.—IMPROVEMENTS.—The Moray Education Authority have decided to proceed with alterations and improvements at Lossiemouth and Dallas Schools at a combined estimated cost of over £2,500.

Arbroath. — HALL. — A scheme has been started in connection with St. Mary's Episcopal Church, Arbroath, for the erection of a new church hall estimated to cost £1,500.

Edinburgh.—RECONSTRUCTION.—The Edinburgh Empire Theatre has been closed for reconstruction.

Judge Jeffreys' Lodgings.

The old half-timbered house at Dorchester known as "Judge Jeffreys' Lodgings," where he stayed during the memorable "bloody assize," has been offered by Sir Robert Williams, of Bridehead, Dorset, the banker, to Dorset County Council for the purposes of a public library.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A Copy will be sent by return, and your Remittance refunded if the Book does : : not satisfy your requirements : :

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXIII. No. 4425. NOVEMBER 25, 1927.

ARCHITECTURAL EXPRESSION

the course of the address which the President of the Royal Institute of British Architects delivered at the opening meeting, he touched on certain considerations which may well be very much in mind at the present time, and with which we are in some form or other constantly ted. "Architecture," the President said, "was a l factor for good to the community. It was always s, and it behoved us to see that it was good." y responsibility for public service and public good e rests upon architects. One thing of great importance r taught us—to pull together and to work together. f course, a fact strikingly illustrated in history again in, and underlying the whole progress and development tecture, that the mind and moral outlook of a nation given time stand written clearly and without possibility on upon its architecture, more than upon any other of its art. Probably the most characteristic feature resent time, and one reflected accordingly in its archi- is the growth of the civic spirit—using the word civic rgest sense. There are indications that we are learning arkable way—in the words of an old mystic (to quote recent letter to the *Times*) to "think generally." For we have lived, architecturally, in a welter of alisation. We have only to consider the difference , for example, Holborn or Fleet Street and the old Street, of gracious memory—or to compare the specu- ilding which has made the suburbs of our great cities, nushroom seaside resorts, with the speculative building ade Bath or the Adelphi or the Bloomsbury squares. anning and the laying out of suburban areas, and planning of the country districts by local authorities, ave been a cause for astonishment to pre-war genera- With us they are the subject of Acts of Parliament, ommonplace of our national life. Collective action forced upon us by the necessity for reconstruction, individual action was not equal to the demand. The re, however, far-reaching. We have developed a nt of view. The architect has to think not merely of the individual client, but in terms of the larger lines ommunity. He has become something of a public -whether he builds a cottage (remembering the beautiful ent traditions of the countryside) or a factory to suit modern requirements according to the most modern of construction. He may build a town, or make a plan for a county, and his standard must needs be a and his training as thorough as it can be made. It raging to know that the Royal Institute of British s is concerning itself as a body very much in the t the training of the architect.

chitect must needs be in the closest touch with present- ities, if he is to give them fine interpretation.

he chaos which is the aftermath of war, we are slowly into what seems to be very largely a new world. which in the normal course of things would have eneration to accomplish, have been greatly accelerated, come abruptly upon us in a few years. We are h new ideas, new conditions, new materials and new requirements. The universal principles of architecture remain, but may it not be contended that they require re-statement and re-application? The most obvious feature probably of this new condition of things is the rapid development of science, not only the science of the lecture-room, but science in its practical application. It is evident that building, which is very largely a scientific process, has been materially altered, and must of necessity be highly organised.

Another of the great changes which have greatly affected architecture is the change which the war has brought about in economic and social life. Capital, industrial conditions, world markets and so on, react upon building. The "economic rent" problem, the "new rich" and the "new poor," the domestic servant problem, no less than the problem of industrial wages—to name only a few factors in modern life which touch architecture—indicate the complexity of the situation. Is there indeed any part of human life with which architecture is not concerned?

It may be contended that the whole history of architectural development consists merely of the readjustment of the traditions of building to meet new conditions, thus combining continuity with vitality. It is surely encouraging to believe that the old tradition was based on practical considerations no less than on artistic values, and such a belief may give a clue to the appreciation of a certain quality which always characterises our architecture. It has never been better expressed than in that most English of definitions—that architecture must possess "firmness, commodity and delight." Where "firmness and commodity" come first—showing that perfect relationship to use which makes great art—and then "delight" last, because that springs naturally from right expression and adds that touch which lifts building into architecture. In face of the economic situation, it may again be necessary to emphasise firmness and commodity first—and to count delight as the crowning touch, a delight which has an enforced austerity.

M. le Corbusier's book, *Vers une Architecture*, which now appears in an English translation, will be widely read in England—pleading as it does for reconsideration of the whole problem of architecture from the beginning, and its reconstruction on logical lines. It is exceedingly interesting to see the development of similar ideas with which the Continent is experimenting. With us tradition dies hard, if it dies at all. Like freedom it

> "Slowly broadens down
> From precedent to precedent."

The deeper underlying motives, the national characteristics remain. Is it unreasonable to expect a new wealth of blossom from the old root? The architect seems to stand between two worlds. He must lead and interpret, he must feel for and with all sorts and conditions of men. He must enter into the national life and supply the national needs with larger understanding and sympathy. There is a new desire for architectural education, that is for the appreciation of architecture, as expressed by eminent laymen, who from time to time have approached the R.I.B.A. Only in this way can we hope to achieve the mastery of architecture as a vernacular art.

NOTES

Westminster Abbey.

THAT the urgency of further space in Westminster Abbey for memorials to distinguished people has been rather overstated is suggested in a letter to the *Times* by Mr. Edward Warren. He points out that there is probably room for interments to carry us over some two centuries still, and for the placing of small memorials even more space available. We cannot surely expect that even a large Abbey Church can contain for an unlimited time all the memorials to those who are worthy of the distinction.

The New Delhi.

THE meeting room of the R.I.B.A. was full to overflowing on Monday night to listen to the very interesting lecture on the "Government Offices of Pretoria and New Delhi" delivered by Sir Herbert Baker, A.R.A., F.R.I.B.A. Some idea of the magnitude of the tasks may be gained from the description of New Delhi, by Sir Hugh Keeling, given on another page; but what struck the audience to a very great extent was the imagination shown in the selection of the respective sites at Pretoria and New Delhi. The Pretoria site commands a magnificent view of the city below, but the selection of the Delhi position must have been much more difficult. The result has been achieved by the partial levelling of a hillock and its connection with the neighbouring ridges.

Industrialism and Architecture.

IN considering the many influences which react on architecture, we are too often inclined to denote the changes in conduct and direction as due to causes within the art itself, as though it were not constantly acted on by influences from without. We seldom show proper consideration of the tremendous force of the impact of industrialism on the art, which has perhaps more to do with the changes in form and character penetrating it than any æsthetic influences in the way of style and tradition. When the manufacturer gradually took the place of the craftsman, it was found advantageous to make use of his facilities, which gave a certain impulse to the resources of the architect in economising of labour and cost. That is to say, a process of industrialising of the art took place, and so early as the time of the Brothers Adam and the later Pugin we see this process conventionalising and mechanising what had before been the field of free craftsmanship. William Morris himself fell a victim to this same influence, and architecture has felt the full blast of it. Nor is there much doubt that the larger amount of injury and destruction wrought to ancient fabrics under the so-called Gothic Revival was due same cause. At this stage the signs we are emerging in response call for a more vital craftsmanshi more corporate endeavour.

Post-War Architecture.

THE rebuilding of cities in the war area perhaps the most co detachment from trad ways, both in form treatment. And even where an tion might be made, the effort traditional only results in car in most cases, so completely dead spirit of old work. Industrialism a in architecture without the cover old vesture, and there is an insiste new and independent approach. perhaps, a better thing not to p to have what you have not wh life has passed out. It is therefor interesting to watch the effect on ing from which all precedent a herited conformities have been drawn. The architecture result more primitive and utilitarian, b without force and energy, runnin into exaggeration and flambuoyanc is arresting rather than commo and it has been suggested, not w truth, that there is an echo of the g it, so divorced is it from anything g So far away is it from the spirit of that the human appeal is almost e absent, exchanged for a sor mechanised efficiency approachi "Robot" architecture. It is an tecture of realists rather than dr of a democracy struggling am raw materials of life, and still a the revelation to restore it to the sion of something higher.

A Complimentary Dinner.

THE complimentary to Mr. C. F. Annesley arranged by the Institute of British tects, and held last Painters' Hall, Little Trinity La was a function of unusual interest redounds to the credit of the R for although Mr. Voysey is not a of the Institute he has be honoured by them. We welco official action, though belated, compliment paid to an archit craftsman whose character and w indicated on the somewhat unusu list provided, which not only m "the wines," "the toasts," "th but informed us that "men of and sense praise from the hear which are worthy of praise" "when we see a natural style astonished and delighted, for w to see an author and find a man "that spirit is a substance in whi ing, knowing, doubting and a moving do subsist." The app ness of these quotations will b ciated by those familiar with Mr. work, as will the felicity and su of the speeches of those who re his capacity and influence. We

ling that one shortcoming in the of the gathering was the absence testimony by some of his brother ts to the value of his work, we do not forget the well-chosen f the President.

nce tity ors. IN a history of the firm of builders, Messrs. William Nicholson of Leeds, that has just been published under the title of "A Centenary of g," there is a strongly-worded of quantity surveyors. It is to be the considered opinion of William Nicholson that much ttention should be given to the at all quantities should be taken experienced and well-trained y surveyors. "In the north of there is, unfortunately, a ten- n the part of some architects to their own quantities. In the England, however, this is hardly ne, and certainly never by first- hitects. . . . The right course 's for the architect to draw his nd prepare his specifications. e quantities should be taken off iable quantity surveyor. Nearly isputes in the building trade have ecause this course has not been . The contractor wants to know ch material he is to supply, and well-qualified quantity surveyor alise accurately buildings before put up. Inaccurate quantities the reasons why the troublesome of extras arises on almost every except those which are for a lump sum. Probably there is no other question which gives so much annoyance to the client, to the architect, and to the builder as unforeseen extras. These are due either to the architect's plans being incomplete, or to the quantitites being inaccurately taken, or, in the majority of cases, owing to the building owner changing his mind."

Concrete and Sculpture.

THOSE who have visited the new concrete church at Villemomble, designed by M. P. Tournon, have returned full of enthusiasm for the extended craftsmanship that has been opened up by the sculptor, M. C. Sarabeyolles. The concrete is not moulded but is worked in situ with a chisel before it has fully set. Judging by the group of huge figures which form the climax to the tower, the material is remarkably responsive to manipulation at the hands of an artist. The texture is left fairly rough, and the incisions are deep and keen, giving a fine shadow pattern. To some extent this group follows traditional representational treatment, but its success suggests that the possibilities of concrete as a medium for sculpture should be examined not only by sculptors but by plasterers and woodworkers.

The Late William Woodward.

WE record with much regret, which will be shared by many members of the Royal Institute of British Architects and the Surveyors' Institution, the death of Mr. William Woodward, some notes of whose career we give on p. 824. In the somewhat bluff and breezy personality of William Woodward were qualities which won the affection and esteem of all who knew him, some reflection of which was afforded by the attendance of many well-known members of the two professions at the memorial service at Hampstead Parish Church last Saturday. Though a man of strong convictions, which he was always ready to press with intrepidity and courage, he had an unusual capacity for making friends, who respected his obvious sincerity, his common sense and sagacity—though they may not always have agreed with him—and whose irrepressible geniality and good humour were recognised as characteristics of an unusually kind-hearted man whose knowledge and experience and practical help and advice were freely given to those in need.

Rural Defacements.

WE are all alive to the injuries being inflicted on the countryside by the erection of unsightly types of buildings springing up everywhere, but are not so alive to the need of public spirit in remedying this state of things. Opportunity is offered of taking steps themselves to remedy the disorders that are devastating rural scenery. But it does not seem to be sufficiently recognised by the public that they have also to play their part, and that it cannot all be done for them.

Concrete Sculpture: Carved Figures on the Tower of a Church at Villemomble.

M. SARABEYOLLES, Sculptor.

GENERAL NEWS

Professional Announcement.

Mr. Guy M. Nicholson, F.S.I., of Messrs. Northcroft, Neighbour & Nicholson, Chartered Surveyors and Valuers, Bloomsbury Mansions, 26, Hart-street, Bloomsbury-square, W.C.1, has taken into partnership Mr. Charles W. Berry, F.S.I., who worked with his firm for many years. The name of the firm will remain unaltered.

An Engineer's Estate.

Mr. George Burton Chadwick, M.I.C.E. (76), of West-avenue, Filey, Yorks, retired civil engineer, left £5,125 (net personalty £5,050).

Band Enclosure, Torquay.

Messrs. Adshead and Ramsey, FF.R.I.B.A., have been selected as the architects to submit designs for a proposed new band enclosure at Torquay.

The "Architects'" Volunteer Corps.

The "Architects'" Volunteer Corps, which carried on from 1914 to 1919, is holding a dinner early in December. Any old members who wish to be present should communicate with Mr. Cecil E. Campbell, 25, Newman-street, W.1.

Newcastle Municipal Buildings Site.

The special committee appointed by Newcastle City Council to consider sites for new municipal buildings has decided to recommend as the most favourable of several sites inspected an area of land, embracing 10,000 square yards, with frontages on Barras Bridge and Jesmond-road.

Proposed Memorial to Miss Gertrude Bell.

A memorial is to be erected in Baghdad to Miss Gertrude Bell, the daughter of Sir Hugh Bell, It will take the form of a plaque, which has been designed by Mr. J. M. Wilson, the architect, who was Director of Public Works in Mesopotamia for many years. The sculpture of the plaque will be executed by Miss Acheson.

Oxford City Extension Scheme.

The Berkshire County Council have decided to oppose the Oxford City Boundary Extension scheme, in so far as it proposes to include small portions of the parishes of Wytham and Cumnor, the whole of the parishes of North and South Hinksey, and the village of Kennington, which are in the county of Berkshire.

Surveyors' Institution: Rugby Football.

The second annual match between fifteens representing the Surveyors' Institution and the Auctioneers' and Estate Agents' Institute will be played on the Rosslyn Park Club's ground, Old Deer Park, Richmond, on Wednesday, November 30, at 2.30 p.m. It is hoped that a large number of members and their friends will attend the match and support the teams.

A.A.S.T.A. Visit.

A visit of the members of the Liverpool Division of the A.A.S.T.A. was recently paid to the works of the Liverpool Electric Cable Co., Ltd., Bootle. The inspection over, tea was provided in the canteen, during which a discussion took place, and numerous questions asked by members were answered by the management of the firm, to whom the chairman, Mr. Capsticks, L.R.I.B.A., moved a vote of thanks for a most interesting and enjoyable afternoon.

Lancaster Royal Grammar School.

The foundation stone of the extensions of the Lancaster Royal Grammar School was laid on November 10 by Sir Norval Helme, the ceremony being attended by the Mayor and Corporation of Lancaster, in state, and amongst those present were the headmasters of the School (Dr. Shackleton Bailey), Rossall School, Sedbergh, Hutton and Morecambe, and also the County Architect, Mr. Stephen Wilkinson, F.R.I.B.A.

Lancashire C.C. Architect's Department.

Lancashire County Council have approved the reorganisation of the County Architect's Department proposed by the County Architect (Mr. Stephen Wilkinson, F.R.I.B.A.). The proposals include the following newly created posts :—Mr. L. Evans to be Deputy-County Architect; Mr. L. B. Winder to be Chief Architectural Assistant; and Mr. I. L. Burdess to be Chief Architectural Assistant, elementary schools.

Fifteenth-Century Mural Painting.

A discovery of interest to antiquarians has been made during alterations to a tailor's shop in Oxford, Messrs. Hookman's, of Cornmarket-street. An oak-panelled upper chamber, which had previously been used by a caretaker, was required for a workroom, and when the panelling was removed from two of the walls there was revealed a fifteenth- and sixteenth-century wall-painting in a good state of preservation.

New Thames Pier.

The Port of London Authority have decided that the Old Swan Pier, London Bridge, one of the most familiar riverside landmarks, is to be demolished in about 15 months time. A new Swan Pier is to be built at the foot of Tower Hill, almost beneath the walls of the Tower. Plans for the new pier are not yet complete, but it is intended to use parts of the Old Swan in its construction. Old Swan Pier will not be completely demolished at once, but will remain in use until the new one is ready.

Old Roman Wall Discovery.

In the gardens of a residence close to York Minster and immediately below the mediæval city wall excavators have found a section of a fourth-century Roman wall still standing to a height of 13 ft., with an interval tower of the same date, 18 ft. square and 14 ft. high, projecting in front of it in the usual fourth-century style. Digging has revealed inside the wall the remains of a block of Roman barracks, apparently built early in the second century and demolished by the Romans or by the action of the enemy.

District Surveyor and Building Surveyor Examination.

Special attention is called to the fact that in 1928 there will be *two* R.I.B.A. Examinations, for District Surveyors in London and for Building Surveyors under Local Authorities. An examination has already been announced for October 17, 18 and 19 (closing date for applications, October 1) but there will be an additional examination on May 2, 3 and 4, and the closing date for receiving applications will be April 11. Forms of application for admission to these examinations may be obtained on application to the Secretary, R.I.B.A., 9, Conduit-street, London, W.1.

New Lecture Hall at Taunton Castle.

At the County Museum in Taunton Castle, on Tuesday afternoon, October 11, the opening took place of a new lecture hall, presented to the Somerset Archæological and National History Society by Mr. William Wyndham, of Orchard Wyndham, Williton. The building, which will be known as the Wyndham Lecture Hall, has been provided primarily for the lectures, given under the Wyndham Lecture Trust, on the history and archæology of Somerset to senior scholars in elementary and secondary schools. The building will also be used by the Somerset Archæological Society for its general and sectional meetings, and by the Taunton Field Club for its winter meetings.

The Progress of Aylesham.

The first section of the new town which is being made a few miles north of Dover, to provide accommodation for some of the miners who are developing the Kent coalfield, will be completed early in the new year and will then have a population of about 2,000. The heads of the families who will occupy these houses are all employed at the Snowdown and it is possible that at some tir future the new town, which has be Aylesham, will have to provide ac tion in connection with the new Adisham or Wingham. We refer ou to *The Builder* for April 15 and which contained illustrations and this new colliery town, together with Patrick Abercrombie's lecture on th read before the R.I.B.A.

London 100 Years Hence.

Mr. G. Topham Forrest, archite London County Council, speaking r the American Women's Club, C street, W., described London as he it would appear 100 years hence. that the suburbs would be contro trically, more would be made of banks, and wide boulevards and tr avenues would lead to notable arc landmarks, from the neighbourhood small buildings of no account removed. In the new suburbs, he L.C.C. were taking steps to make it impossible to create slum areas. T planning in advance; houses would mitted here, and not permitted at and in time each house would defin tribute its part to the beauty of t as well as to the comfort and conv the people. The open-air markets would be improved to bring them with the picturesque markets of the and more emphasis and dignity brought to bear on the civic centr suburb. Central London was grad coming higher, the buildings were t they used to be, but sky-scrapers co very beautiful, and London would n them, because her streets were enough for buildings of that heig greatest architectural changes in hundred years would take place in bourhood of Charing Cross and Wat

ST. PAUL'S CATHEDRAL

WORK OF PRESERVING THE FABRIC.

WE have received from an architect of standing, who has made the subject of ecclesiastical architecture a life-long study, the following letter for publication dealing with alternative proposals for the preservation of St. Paul's Cathedral :—

SIR,—The publication of the extracts from the fifth report of the Work's Committee on the preservation work at St. Paul's in *The Builder* of November 18, and Mr. William Harvey's letter published in "Truth of November 2, will, I feel sure, revive public interest and anxiety about the condition of St. Paul's if, as Mr. Harvey states, the Works Committee do not understand the building, have no proper scheme of repair, and are merely drifting, and the work is a continuation of "patching" which has been going on for the last 200 years, and is now likely to go on "until the dome falls."

In his book, "The Preservation of St. Paul's Cathedral and other Buildings," he states that the need for the constant repair of the Cathedral ever since it was built, and its condition at the present time, are due to Sir Christopher Wren's lack of architectural training, and ignorance of construction, and consequently his faulty design of the Cathedral; drawbacks which Sir Christopher Wren had in common with other architects, and that it is "marvellous that the patchings have not already achieved the destruction that they have undoubtedly hastened."

He has repeatedly urged in the last three years that the present work may probably be the last "patch that the weary building will endure."

According to Mr. Harvey, the patching of the Commission's scheme seems a very serious matter indeed, and I venture to suggest that the Commission's scheme should now be carefully examined in the public interest and compared with the alternative scheme which Mr. Harvey has advanced and described and illustrated in his book.

Surely the architectural profession cannot quietly sit down with folded hands and await the irreparable disaster which Mr. Harvey foretells as imminent? It seems almost inconceivable that those who are responsible for the work are really relying on him for instructions on how to get on with the good work, and refuse to acknowledge any indebtedness to him.

But in looking through his book I find some difficulty in understanding his proposals. No doubt he is well acquainted with St. Paul's, and that what he says is "crystal clear" to him, but perhaps it is not so to the ordinary individual who only sees St. Paul's as a visitor.

It seems to me that in such an important matter we are entitled, first of all, to ask :— "Is Mr. Harvey a competent critic?" Secondly, "Does he know everything about St. Paul's Cathedral or its design?"; and thirdly, "What is the nature of his comprehensive scheme of conservation?"

He is obviously the best person to answer these questions, but during the last three years, although he has severely criticised the work that is being done and the personnel responsible for it, he has not given any convincing evidence on these three points except his *ipse dixit* and "the highly deceptive" "fragmentary drawings" in his book.

In his book, figure 18, page 26, is a section through the transept of St. Paul's on the line of the great piers, which shows a most alarming construction. If it fairly represents the case, it appears to call imperatively for some such comprehensive scheme of conservation as he proposes, especially as he says "the Whispering Gallery and the great inner drum stand out several feet over the internal space between the piers."

The Whispering Gallery is a balcony, and a projecting feature which incidentally strengthens the wall, and therefore cannot really be described as "standing out several feet over the internal space," but surely the wall itself does not "stand out several feet." Would Mr. Harvey kindly explain this, and give the actual dimensions of the projection of the wall itself? It would assist to make this matter clear if he would say where the particular section which he illustrates occurs. It does not appear to correspond with other sections illustrated in his book.

Except figures 32 and 33, cross and longitudinal sections of the building, the construction of the existing building, affected by the concrete cone and its arch-like supports, has been omitted from the illustrations of his scheme, no doubt, for "the sake of clearness." This absence of detail is especially noticeable in the diagram of the arch-like supports to the base of the concrete cone.

The concrete cone itself is not shown on his general diagram, nor any parts of the existing construction, except below the arch-like supports, and even construction below them is only roughly indicated. It is therefore most difficult to visualise his scheme from the illustrations. Will he kindly give a little more information, and a few dimensions and calculations, and especially a stress diagram of the concrete cone and its arch-like supports, and of the existing building which is cut through or altered by its erection?

With regard to the cutting away, he explains that it will be necessary to cut the inner wall practically all round below the cill of the clerestory windows and also "the peristyle wall in order to pass the cone through it." It seems that it will also be necessary to pare off the 32 counterforts in order that the cone may be intact, and he must also cut through the arches connecting the cross walls between the inner and outer walls of the dome and the arches strutting the piers from the bastions and also "the more distant arches above the aisles."

He also hints that the removal or at least considerable alteration of the existing staircases; sleeper walls and pavings above the vaults will be required to construct the cone, which it should be borne in mind is primarily a shore to enable the essential repair to be carried out. The shore, however, is to remain as a prop to the dome, but it seems that it will really be an enlargement of the dome.

The staircases, the sleeper walls and pavings above the vaults, are apparently somewhat important parts of the fabric, and are not there merely for "convenience," as he would have us believe. Would Mr. Harvey kindly say if there is any more preliminary pulling down or cutting about required?

The principal work which he recommends is the rebuilding of the piers, or at least gutting them and largely refacing them. As the Portland stone facing is in such a very bad condition as he describes, is it worth preserving, especially as once the concrete cone is erected, the front part of the piers will not be required any longer and can be taken away.

One begins to wonder how much of the original building will be left unpatched or even standing by the time he has completed his "comprehensive scheme of conservation." Perhaps Mr. Harvey would very kindly enlighten us about this also. The description of how much will remain cannot be very long. Of course, there is no doubt St. Paul's Cathedral would be improved if re-designed and reconstructed!

The present dome covers an area of 110 ft. diameter, but the new dome which will result from the construction of the concrete cone will cover an area of about 150 ft. diameter. All the lower parts of the dome and the front part of the piers will be redundant, and the greater area which will result from the removal of redundant construction will greatly increase the accommodation. We shall get something worth having for the expenditure, which may be somewhere about £1,000,000, without the cost of altering the choir, transepts and nave. It seems desirable while the work is being to conform to the new design and ge full benefit of the improvement. As Harvey points out, the complete scheme in any case extend to them as well dome area.

The general impression is that the of the preservation work is to preser Paul's Cathedral as designed by Sir topher Wren, *i.e.*, the wonderful bu which exists, for the preservation of the necessary funds have been subscrib

Mr. Harvey, however, seems to think differently. He appears to think that defects and dangerous state of the bu are primarily due to Sir Christopher W design, and that the construction is contributory, the design must be alte remove the cause of trouble, and the of his conservation scheme is to cu cause of the disease and so prevent rence of symptoms for all time.

He points out that incidentally h obtain the great advantage of demonst the thoroughness of repair which can tained by the "new science of conserva advocated by him, and "developed in t decade," which aims at "scientificall inconspicuously restoring buildings an serving the existing work without al its appearance" or showing how it is It thus avoids "the patching with material in the form of piers, props, and buttresses, alternating with the il processes of demolishing and rebuildi the same or even a different style characterises other methods of preserva

May we conclude from this demonst that he hopes to show how well the bu could have been designed by Sir Chris Wren had our critic been born soone what the Cathedral surveyors who ha ceeded Sir Christopher might have a if they had only been trained ir interesting science? He seems to wis be a demonstration to the members 1921-25 Commission and the Works mittee and the Cathedral staff of St. of the fallacy of their methods, and t the architectural profession generally, outstanding example, the best way o ing with other monumental buildings country in the future.

Possibly he hopes that the misfort St. Paul's Cathedral will prove a bles disguise and an additional subject f mentary schools, so that in the future child of the present day may or a might know as a truism constructiona that Wren's great mind only disc after a life's experience."

INQUISI

Lewes Castle.

The proposal to erect offices on a site the precincts of Lewes Castle has com before the East Sussex County Coun was reported that if the County Counc unable to use sites adjoining or suff near to the present County Hall, wh Assizes, Quarter Sessions, and Petty S were held, there appeared to be no alte but to build entirely new offices else This alternative would involve an expe of £90,00 to £100,000. After considera cussion, recommendations of the co were adopted which give the Count Committee authority to acquire Ca House and the property in the Castl and also to proceed with negotiation further site or sites.

Ancient City Churches.

Mr. Mervyn Macartney, architect Dean and Chapter of St. Paul's Cathe a lecture illustrated by lantern slides College, referred to the fine stained some of the churches, and said that the glass was in urgent need of cleani condition made the churches very dar ought to be much prouder than we the beauty of some of the monument churches. That we were not was perh to the fact that we had a surfeit o He believed that in any other count attention would be paid to their pres and that replicas would be put in m

GOVERNMENT OFFICES OF ORIA AND THE NEW DELHI.

neeting of the R.I.B.A. at 9, Conduit- n Monday evening last (the President, lter Tapper, A.R.A., in the chair), Sir Baker, A.R.A., read a paper on this

The two buildings, he said, were l to house the national administration new capitals: the one at Pretoria, by a National Conference of the Free n 1909 as the Administrative Capital Union of South Africa—the Parlia- capital being at Cape Town, 1,000 vay; the other at Delhi decreed by roclamation in 1911 as the new capi- British India. The city of Pretoria valley at an actual height of about above the sea, but relatively low rrounding rocky hills or kopjes and eau of the high veldt. In a latitude grees, so near the tropics, the ques- emperature came to the aid of those ocated the rejection of a site in the f the town first chosen for the pur- d the selection of a more ambitious on the surrounding hills.

were four main planes of levels round lings The lowest is the tram road; above it is the driving road; then t terrace, just below the ground d at the lower level of the amphi- this last rose to the top of the atre at the level of the first floor n upper road against the back of ling under the kopje which rose 100 ft. above. From the tram road re covered passages to the building s and staircases to the upper floors. hitheatre was formed for the main the natural levels inherent in the he design. Between the level of the loor terrace and that of the upper oad, rising steps and platforms fitted into amphitheatre form round the rtion of the semicircle under the . The inside portion of the sem- ing the central rostrum had been ly sunk as a little amphitheatre. As 8,000 people had gathered in the atre and colonnade, and it had be- traditional place for national cere- ceptions.

debate in the House of Commons on tration Bill, a member held up the examination to scorn, because the had set the question "to describe amphitheatre." Now it seemed to that examiner set a very wise All over the Empire, where the uld generally be depended upon, -of-doors meeting-places did and believed, still more in the future f public and national importance. een many such open-air durbars, as called in India, and two recently ia. The place was sometimes tem- uilt, if built at all, and therefore lacked the dignity which an ordered architectural form could give. Surely, too, with the advent of loud-speakers, large stadia or amphitheatres might become in the future essential architectural necessities in all countries.

The rest of the plans of the Pretoria buildings would explain themselves. There were fireproof record rooms for current records centrally placed over each other and on three floors. The Governor-General's and Ministers' rooms had the distinction of access to a great columned portico commanding a view over the ever-extending garden suburbs in the valley, and over the surrounding kopjes and the distant hills rich with the romance of Transvaal history. There was a conference room with a vaulted tea-room under it, and opposite to it across the colonnade a large circular library. The southern, or sunless in that hemisphere, aspect of the front façades, which were of great length as demanded by the steep contours, when seen from below and at a distance, did, indeed, tell against its beauty, especially at mid-day, when the side elevations were nearly sunless also. On the other hand, at the building itself the long shadows that never forsook the front terraces and the amphitheatre, afforded coolness and absence of glare, so invaluable in a hot, bright climate, and the beauty of contrast of light and shade. These were more than compensation for the loss of effect from the distant view. The design of the building without continuous verandahs with only moderately thick walls, and rooms not very high as rooms were wont to be in the tropics, its shutters and deep eaves, seemed to suit the climate of Pretoria, where altitude counterbalanced latitude. It was much the same distance from the equator as Delhi, where greater precautions were taken and greater risks incurred in combating the greater heat.

The basement and ground floor of the buildings above the granite plinth were faced with a local light-coloured sandstone. Inside, the main corridors, courts and staircases were faced with a hard red sandstone. The roofs were covered with convex concave tiles made in the Transvaal. The rain-water gutter was hidden by being sunk into the tiles, the under tile being omitted while the overtile concealed the metal gutter from most points of view. The joinery was generally of Indian teak but some of the panelling and all the furniture was of South African woods.

The slope of the hill below the tram road down to the level of the valley had been terraced with walls, steps and paving built of the rough stone of the neighbouring kopjes, a coarse, iron-stained slate, blue-grey and warm brown in colour. On the terraces were beautiful gardens well cared for by the botanists, foresters and horticulturists of the Department of Agriculture and the Public Works. The rich dark colour of the masonry of the terraces formed the background for the yellows, oranges and scarlets, the prevailing colours of the aloes, cotyledons, mesembryanthemums, and many other African sun-loving plants which throve on the hot terrace walls. The twin high-domed towers seemed to demand, and, indeed, were designed for a setting, as seen from below and at a distance, to a central building on the top of the kopje.

Dealing with the New Delhi, the lecturer said the Secretariats, as the administrative buildings of the Government of India were called, had a different relation to the Viceroy from that of the Union Buildings at Pretoria to the Governor-General. The Viceroy, as Governor in Council, was the head of the Government of India, in a position comparable to that of the Prime Minister of a self-governing Dominion like South Africa. To meet, therefore, the practical needs as well as to give expression to the political idea of the Government of India as a whole, the Secretariats and Government House had to be composed as an architectural unity. In South Africa the Governor-General presided over the meetings of the Executive Council and not over the Cabinet; at Delhi, Ministers and Secretaries went daily to the Viceroy at Government House as the supreme head of the Government. Thus the two buildings at Delhi could not be far apart.

The site chosen by the Commission on the south of the old town presented no high ground rising from alluvial plans of the river Jumna, except a small outcrop of rock, a spur of the Ridge where it spread and flattened on that side of the old city. On this it was decided to place Government House and the Secretariats. When the top 20 ft. of the quartzite rock had been blasted away and tipped into the hollows, a platform was formed against which was built a wall about 30 ft. high at its lower end. On this the Secretariats were placed. They were divided into two blocks, the front outer wings of which were 150 yds. apart, 100 yds. separating the inner porticos. They stretched from front to back nearly a quarter of a mile. Rather more than a quarter of a mile back in the centre stood Government House, its "piano nobile" being 20 ft. above that of the platform and the ground floor of the Secretariats.

The Processional Way, lined with three deep big-treed avenues and long fountain pools, commenced at Sir Edwin Lutyens' great arch, the Indian War Memorial, one and a half miles down the plain, rose at the rock platform and continued through Government Court, which lay between the two blocks of the Secretariats, into the Viceroy's Court, the railed-off privileged forecourt to Government House. The Processional Way was intended for ceremonial use. The main driving entrances to the Secretariats would be through covered porches at the outer sides of each block at the plain level, as well as by many smaller doorways. The two blocks were generally similar in plan to each other, with the exception that the north block contained an octagonal public hall, high domed and lit through the pierced stone screens, which were a distinguished feature of northern Indian architecture. Round the dome were staircases, open and spiral, and lifts, post and inquiry offices, and committee rooms.

The south block central entrance consisted of a broad vaulted stairway opening through to courts and fountains on either side up to the ground floor, from which double staircases led up to a large domed conference room surrounded by loggias, libraries, and reception rooms for the official hospitality of the Government of India. On the first floor the rooms for the Ministers—or Honourable Members as they were called in India—and committee rooms were given, as at Pretoria, the distinction of great porticos, deep enough for shade and air at all times, and commanding a view over the New City, and the walls, domes and minarets of the older cities of Delhi. Amongst them the distinctive feature of the landscape was the Kutb Minar or Tower of Victory, built by the Mohammedan conqueror about A.D. 1200. It was 250 ft. high, a height to which the towers of the new city could not aspire.

As to the practical planning, there were no distinct Record Rooms as at Pretoria, but the floors of most of the general offices were calculated to take the weight of current records. The large basements, built wherever the rock was not, took the overflowing records until in fulness of time the more precious files reached their final resting-place in the Record Office which was being built elsewhere, in Delhi. The only fixed and defined allocation was that of the Foreign and Political Department, which occupied the western wing of the south block, and was quite shut off from the rest of the building. Definite allocation of departments at the beginning was impossible; in fact, there had been, he thought, two Civil Service Commissions sitting during the fourteen years of the building operations. The allocation was vertical through the three stories, which the abundance of stairs and lifts made possible. There were vacant courts unbuilt on, providing a 25 per cent. increase of accommodation, which could be cheaply built. The roof being flat and the parapets high, the planning of drainage shafts was simplified, and so there were throughout

many shafts and ducts or tunnels, so that all pipes and wires were easily accessible, and none appeared on any visible wall surface.

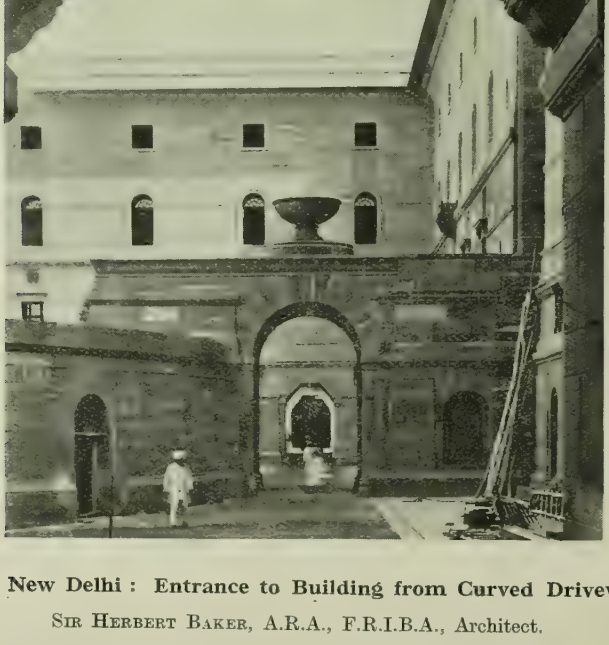
A novel feature of the design, unusual in the tropics and plains of India, was the absence of continuous verandahs. It was held that verandahs, especially on the east and west—the low sun sides—were only effective if made so low as to darken the rooms on cloudy days and towards twilight, and that heat radiated slowly from and clung to verandahs. On the other hand, it was held that the walls if thick and hollow would keep out the heat, and if uncovered would quicken the radiation of the heat; and that outside louvred shutters would keep the sun off the glass and would facilitate the regulation of the light in the rooms. Verandahs where they were used were mostly deep and of short length, in the form of loggias or projecting porticos.

The style of the Secretariats must speak for itself. In them an attempt had been made to design in accordance with the more elemental principles of all architecture, a class of building—offices of an administration Western in its origin and usage—for which there was no tradition in old Indian architecture. Into those elements had been woven such Indian features as were suitable to the conditions and climate and which could blend harmoniously with the design as a whole. The chief of those features was the chajja, the overhanging cornice, consisting of stone slabs projecting up to 8 ft. from the face of the wall, supported on a stone cove or bracket—keyed and dovetailed back into the wall. These were distinctive features of the old buildings of India. In the pre-Moghul buildings they were found cut in hard quartzite with ridges and grooves—evidently in imitation of burnt tiles, at great cost of labour, and must have been unseen and useless. The Moghuls used the chajja up to a 9-ft. projection in the Palace of the Delhi Fort. Those slabs were easily quarried in the sandstone from the great quarries near Agra, out of which the Old, as well as the New, Delhi was built. The laminated, easily split nature of that stone dictated, he believed, the carpenter-like style of much of the Hindu-Saracenic architecture. Pierced stone screens, called jalis, were freely used. They let in the air and kept out the sun. Their only objection was that they were not proof against duststorms nor against the incoming of the innumerable birds which soiled the Indian buildings.

The labour employed had been entirely Indian, with Indian contractors under the direction of Sir Hugh Keeling, the chief engineer, and the supervision of the engineers and inspectors of the Indian Engineering Department, and a few British foremen, who were the salt of the workmanship. A link between the work at Pretoria and Delhi was the work of Mr. Cairns, who acted as foreman mason at Pretoria and as executive engineer in control of the immense masonry workshops at Delhi. The Indian mason and joiner as the work proceeded added a greater precision to their inherited skill and industry.

Discussion.

Mr. H. V. Lanchester, F.R.I.B.A., in proposing a vote of thanks to Sir Herbert, said, although he had not visited South Africa, that the buildings at Pretoria had been carried out in a wonderful way on a site whose possibilities had been seized in a very inspired manner. He had seen Delhi before building commenced there, and had found it very difficult to visualise any suitable site. He had not grasped the possibilities of the plateau where Sir Herbert Baker and Sir Edwin Lutyens had made their site by cutting off the top of a little hill and linking it up with the spurs of the surrounding ridges. The difference between the two sites at Pretoria and Delhi had brought about a very different arrangement of the buildings, and he was particularly interested in the manner in which Sir Herbert had carried out the designs for his building. He would say that he had noticed the absence of verandahs, as he himself favoured the traditional style of having verandahs flanking the walls. He was also interested in Sir Herbert's constant use of the dome, which was the natural way in which the Indian covered a void.



Sir Hugh Keeling, K.C.I.E., late chief engineer for New Delhi, seconded the vote. He said he was very glad of the opportunity of saying before Sir Herbert's fellow a tects the pleasure it had been during the thirteen years to be in association with As some of them might know, there had some difficulty regarding money, but work had always gone on. He would li give some popular indications of the si New Delhi. To start with, the actual of the lay-out of the whole project w times the size of Hyde Park! The number of residential quarters were 4,000, while at one time on the project had 29,000 labourers, and when towards end they were reduced to 14,000 they tho it very hard! The total mileage of rail carrying bricks was 70, and the ra system was capable of a carrying capaci 1,300 tons a day. Not once in thirteen y said Sir Hugh, had he known that ra when it was completely idle. The stone came from Agra, which was built at the of the eighteenth century, so there was fear but that it would last. In conclu Sir Hugh said that New Delhi was a jewel out of its setting, but that se undoubtedly would come.

Sir Lionel Jacob, K.C.S.I., in suppo the motion, said he would like to say thing regarding the absence of veran He and Sir Hugh Keeling did not see to eye in this, for Sir Hugh could work where—even in the Black Hole of Calc heat did not affect him. But for the ord mortal the verandah was a necessity, for had acquired a verandah habit. A frie his had just written him from New D and in describing the place he said, "I come to a verandah-less Delhi." It mig all right for the cool weather, but i Government sat during May, June, July August, the heat would be appalling.

Mr. J. D. Hossack, O.B.E., A.R.I. then gave a short account of the Pretori When engaged with the Public Work partment, he had gone for six months the Government Buildings works, and h that Sir Herbert had not let them know a wild and rocky place it was. The buil if entrusted to an inferior man, might been placed easily in the middle of the The site as it was was a magnificent or had been utilised to the full.

Sir James Rose Innes said that the graphs showed nothing of the beauty buildings with their strong yet graceful In South Africa they owed a lot to Si bert Baker. He had left the stamp genius upon the continent. He, the sp remembered that when he was a child was growing up a style of architecture was intolerable. Sir Herbert cam studied the best of the remaining ar ture, particularly in its relation climate.

The vote of thanks put by the Pr was accorded heartily, and Sir Herb reply, said that the absence of con verandahs was due to the fact that intended to use the building only weather.

The New Delhi: Entrance to Building from Curved Driveways.

Sir Herbert Baker, A.R.A., F.R.I.B.A., Architect.

The League of Nations' New Buildi Geneva.

A desire having been expressed t designs submitted by British compet this competition should be publicly ex the R.I.B.A. Council have arranged exhibition of a selection of the drav take place in the R.I.B.A. Galleri Friday, November 25, to Saturday, ber 3, inclusive, between the hours of and 8 p.m. (Saturdays 5 p.m.). The tion will be open to the public and a will be free.

R.I.B.A. London Architecture M

Nomination forms for this award h been issued by the R.I.B.A. Forms be returned not later than Febr 1928. Architects are in no way p from nominating a building erect their own designs.

ORRESPONDENCE

we are glad to publish letters on professional r matters of interest to our readers, it must be od that we do not necessarily endorse the remarks pondents, who will oblige us if they will express us as briefly as possible.]

The Death Watch Beetle.

—With regard to Mr. Flockton's letter death watch beetle, it would appear ne terms of this letter that the beetles ound attempting to enter the timber. ust indeed be so, as their tails would e been protruding as is stated if they nerging from the timber. The damage er is not occasioned by the beetle, but caused by the tunnelling of the larva the pupa stage is reached, when the beetle emerges and takes what has lled its "nuptial flight." Not infre- do we find dead beetles occupying the e of a "flight hole" existing in tim- icked by the larvæ of Xestobium, but "flight holes" were actually present pitch pine it is impossible to say or no it was indeed attacked by the estobium.

urse, it is generally known that the holes" in timber represent a very roportion, almost infinitesimal, of the which is likely to have been caused the timber, as the larva is said to ithin the timber, burrowing contin- for a period of from two to three fter which it makes a transverse tun- he surface of the wood, goes through a stage, emerges as the perfect beetle, es its flight from the wood, afterwards ts eggs upon the timber once more, e larvæ hatch out, and enter the tim- eating the cycle.

no direct evidence that the larvæ im normally burrow into pitch pine, ve found pitch pine heavily attacked obium, and in each case it would ap- t the pitch pine had been in position eat number of years. In any case we at a furniture beetle allied to Xesto- z., Ptilinus pectinicornis, does attack ine, but normally the death watch tacks only hardwood timbers. I have nstances on a number of buildings dinary deal has been heavily attacked bium, and I have also found instances ine wood has been attacked, though this attack only occurs when the s timber is very old and has lost a portion of its resinous matter is not It can only be ascertained by careful tion.

tch pine used in Sheffield Cathedral probability fresh and resinous, and ight prove unsuitable for the imme- ack of the larvæ Xestobium. I would say that in all probability, and sub- urther experimentation, pitch pine is kely to be attacked as other wood, her after a long period it would re- e from attack appears to be ques-

FRANK BAINES.

I have read with interest Mr. Flock- e in your issue of November 11, page I seems to me the account he gives is ccord with the generally accepted he life of death watch beetles. Some a I was exercised as to the best way g with the pest, and tried to learn s known on the subject of its life edations. Amongst other sources of on I got the pamphlet, "Furniture issued by the British Museum History) Economic Series No. 11, by C. J. Gahan, D.Sc., which deals furniture and death watch beetles y. It is stated that the beetle does *into* the wood in its fully matured stage, but when the pupa has com- at stage of its existence it *emerges* interval from the timber in beetle

es not agree with Mr. Flockton's It would be very interesting to have her information on the subject. Ac- Mr. Gahan's theory as to the beetles flying about during certain months, I tried sticky fly-paper suspended in various places with the object of catching the "beetle" when it was in the winged stage, but not with much success.

Have any of your readers tried painting the timbers with a sticky or adhesive solution so that when the female sets about laying eggs both the beetle and eggs might be caught? Mr. Gahan refers to the furniture beetle attacking pinewood, and states that the beetle usually confines its attention to the sap wood, the harder parts being more immune from attacks. The damage done all over the country, both in furniture and constructional work, is very extensive, and it would be quite worth while if a comprehensive investigation could be undertaken and suggestions made both of a preventive and curative nature as an extension of the work of Mr. Gahan.

MAX CLARKE.

Herne Bay Municipal Offices Competition.

SIR,—I note in last week's issue of your Journal that an anonymous correspondent signing himself "A.R.I.B.A.," airs his grievance, or supposed grievance, with the assessment of this competition, and which he assumes is shared by other unsuccessful competitors; but, as one of the latter, and also an Associate member of the R.I.B.A., I should like to state that I, and probably the majority of those who took part in the competition, do not agree with the abovementioned correspondent for the following reason :—

"A.R.I.B.A." has, I think, overlooked the preamble to the Conditions and Instructions on page 6, which informs competitors that "the Areas or *Sizes* in this Schedule are *approximate* and *can be varied to suit circumstances in planning*," and therefore the assessor has not failed to enforce this condition, or, as far as I can see, any other.

I should like to add that I think that if a competitor in any competition subsequently uses the medium of the Press to air a complaint as to its assessment he should not do so anonymously; otherwise, it involves competitors who are perfectly satisfied, although not successful.

J. O. COOK.

As competitors in this competition, we should like to endorse every word of "A.R.I.B.A.'s" letter in your issue of the 18th inst. As your correspondent states, the size and disposition of the bank had a very material bearing on the planning. That this was so, and that the conditions were ambiguous, was shown by the many questions from competitors on this point. The answers to questions, however, threw no further light on the matter, as the competitors were simply referred back to the ambiguous instructions that had caused their queries.

In order not to waste competitors' time and money by imposing conditions which in the end are ignored, we think the Institute should add to its great services to the profession in the matter of competitions by impressing on owners and assessors that rigid conditions should only be imposed after very careful consideration, and that, when once imposed, should not be departed from when plans are adjudicated upon.

EUGENE C. BEAUMONT & SON,
Competitors.

SIR,—I should like to endorse the comments made by your correspondent in last week's issue with regard to this competition. When a fully dimensioned plan of a bank, stated to be intended to occupy a certain portion of the site, is issued to competitors, with the instructions that "designs must be such as to conform with this plan," it is reasonable to infer that designs not so complying would infringe the conditions. A plain reading of these would be that only interior dispositions were to be altered, especially as the "Answers to Questions" referred the competitors to the original wording. It would thus seem that any design involving an alteration in the shape of the bank, though obviously advantageous, would *ipso facto* render the provision of such a plan an unnecessary complication to all concerned.

It would be interesting to know how many competitors took this view, and, if the majority, then one important conclusion, at least, would seem to be that much greater care is necessary in drawing up conditions, and in answering questions in an unambiguous manner; and further would seem to be another argument in favour of the jury system, as opposed to the entire discretion of one assessor.

A.R.I.B.A.

SIR,—Is there no referee to whom architects can appeal against a seemingly unjust award in architectural competitions? I suggest that the R.I.B.A., at whose instance the majority of assessors are appointed, should have a small committee to whom conditions should be sent prior to distribution to competitors, for the sole purpose of seeing that they are framed in straightforward, single-meaning sentences.

If you have seen the conditions of the recent Herne Bay Municipal Offices competition, and have studied them in conjunction with the awards, especially in regard to the plan of the bank, you cannot have failed to appreciate the necessity of a referee or of some means of eliminating all possibility of misinterpretation of conditions.

The assessor of this competition, to my mind, acted most unreasonably in not making this very badly framed condition clear when the question was raised by one of the competitors. It would be interesting to know how many of the designs submitted show an interpretation of this condition different from that of the winner.

"H."

Westminster Abbey.

SIR,—The alternative sites for an extension to Westminster Abbey (which are mentioned in the Report of the Cathedrals Commission) may or may not meet with general approval. There is, however, a point of the greatest importance to be met which so far has not been the subject of any comment. The extension of a building of the importance of Westminster Abbey, an importance enhanced by the national character of many monuments of distinguished persons which it contains, is surely a fit subject for an architectural competition open to all architects in Great Britain.

In making this suggestion my Council is confident that it is expressing the hopes of many young architects. A striking example of the success of this method of selecting an architect is provided in the case of the Liverpool Cathedral. An open competition was held and the winner was a young architect who was at that time an assistant.

It may be a little premature to write upon this proposal, but my Council trusts that its suggestion will receive the fullest consideration when the proper time arrives.

JOHN MITCHELL,
General Secretary, Association of Architects, Surveyors and Technical Assistants.

[**Other letters are unavoidably held over until next week.]

London, a Century Ago.

The Homeland Association, Ltd., of Covent Garden, have recently issued a new book illustrating London one hundred years ago, under the title of "The London of Our Grandfathers." The book—priced at 3s. 6d. net—is the work of Mr. Gordon Home, and makes most interesting reading. It is illustrated by nearly fifty illustrations, taken largely from engravings by Arnald Bryant, G. and T. H. Sheppard, Tallis, Schneffelie, Clarkson, Stanfield, etc., which give a vivid representation of London as it was first seen in 1830 by Dickens and Thackeray.

COMPLIMENTARY DINNER TO MR. C. F. A. VOYSEY

In the hall of the Painter-Stainers' Company, on Thursday last week, a dinner was given in honour of Mr. C. F. A. Voysey by friends who wished to pay a tribute to the services he had rendered to the art of architecture and the allied crafts. The function was arranged by the Royal Institute of British Architects, and amongst those present were Mr. Walter Tapper, A.R.A. (President of the R.I.B.A.), in the chair, and Messrs. W. H. Ansell, J. Armitage, C. R. Ashbee, Robert Atkinson, Henry V. Ashley, W. Aumonier, W. S. Barclay, P. A. Barendt, R Anning Bell, H. C. Bradshaw, L. H. Bucknell, E. F. C. Bucklev, Comm. E. Canzioni, Lt.-Col. Cart de Lafontaine, Messrs. Walter Cave, H. B. Creswell, W. E. Vernon Crompton, E. Guy Dawber, Rudolf Dircks, Walter Donne, J. H. Elder-Duncan, Sir Walter Essex, Sir Banister Fletcher, Messrs. J. Ernest Franck, J. Alfred Gotch, F. Goulden, Alfred Gray, Count M. Grixoni, Messrs. Stanley Hamp, R. H. Haslam, P. Heffer, C. A. Hindley, E. J. Horniman, George Hubbard, T. B. Hyslop, Selwyn Image, G. F. Jackson, Gilbert H. Jenkins, Arthur Keen, Sir Edwin Lutvens, Messrs. Ian MacAlister, A. H. Macmurdo, Sir David Murray, Sir Francis Newbolt, Messrs. F. Winton Newman, Basil Oliver, Dr. Steele, Perkins, Messrs. Henry Perrin, W. T. Plume, Andrew N. Prentice, Col. H. E. Raymond, Messrs. W. Bainbridge Reynolds, G. A. Fred Rogers, J. S. Risien Russell, C. D. St. Leger, H. D. Searles-Wood, D. F. Slothouwer, F. Spenlove-Spenlove, J. C. Squire, Alfred Sutro, C. J. Tait, Cecil Thomas, C. Harrison Townsend, Laurence A. Turner, Sidney H. Turner, Gerald Unsworth, E. White Wallis, Thomas Wallis, Edward Warren, T. Spencer Watson, Maurice E. Webb, F. R. Yerbury.

After the loyal toasts, the Chairman proposed the health of the guest, who, he said, was a man whom they loved to honour as an architect. He believed Mr. Voysey had reached the age of three score years and ten, but he was still a boy in spirit. Voysey's work expressed his character as an architect's work should do. He was an earnest man; he was modest; he was a man of strength; he had a fine dignity; and these qualities his work expressed to the full. Their guest was not a member of the Institute, but that made it easier for the Institute to entertain him, and in so doing to honour themselves. At the age of seventeen Voysey was articled to J. D. Sedding for five years, after which he was for a short time in the office of Saxon Snell. Thence he went to the office of George Devey. Then, in collaboration with Lond de l'Isle, at a time when formal gardens were not thought fashionable, he designed the wonderful gardens at Penshurst. After that he began practice on his own, and did much domestic work and much in the way of design of furniture, fabrics, and wallpaper—a diversity of practice that did not come to many of them, and all done with superb workmanship. In his drawings of flowers, trees, birds, his individuality was expressed early in life. He had a freshness of mind and individuality that had not been excelled in modern times.

The toast was supported by Mr. E. J. Horniman and Sir Walter Essex.

Mr. Horniman said he first came in contact with Mr. Voysey 34 years ago, when he designed a cottage for him: not only did he do it remarkably well, but he did not exceed the estimate. Voysey claimed to be a Conservative, but in reality he was an anarchist; he did not believe in law, or, at all events, in Building Acts. Neither did he believe in order, for he had probably never followed the three orders of architecture. He had always found Voysey a very personal and positive agnostic, in the sense that he did not believe what he was told was true, but he believed what he himself thought was true. In his art Voysey had a very rare quality nowadays in that he was a very sincere man; he did what he thought to be right, regardless of cost. He was an admirable architect, a wonderful designer, a man keen on his work; and to this day he was young in spirit, in energy, and ability.

Sir Walter Essex said his first acquaintance with Mr. Voysey was forty years ago, when their guest captivated him with wallpaper designs which made him feel that he was in the presence of a new force, for the designs were full of expression and new ideas. Their guest never studied his personal interests, but was governed by high ideals and with a desire to give expression to what he believed was the God-given spur of energy contained within him. When he first saw Voysev's early designs he was convinced that if they were to be rightly interpreted they needed just as fresh a departure in the mechanical colour treatment, with the result that Mr. Voysev spent some time in the factory helping with the colouring. The experiment justified itself, for the papers captivated all for whose opinion he had a shred of respect.

Professor D. F. Slothouwer (Holland) also spoke. It was, he said, his privilege to let them know what the name Voysey meant to Holland. The purity and honesty of all the architectural work their guest had done was one of the best things he had ever seen.

In replying, Mr. Voysey said to hate the sin and yet love the sinner must assuredly denote a noble mind, especially when that heterodox sinner had persistently rejected the honours and privileges of membership of their Institute, for no other reason than that he had held strong views on architectural training at variance with the prevailing custom (though greatly improved of late), and believed with Ruskin that "Knowledge is got by travel—but wisdom by staying at home." He invited them to recall the condition of their profession prevailing in 1874 (when he was articled). The man whose influence was then most potent and widespread was John Ruskin. Stvleism was still the dominating principle. When a client came to order a house, the main questions were "What style; what period?" Not "Where is the site, and what the aspect and prospect, or the materials of which it is to be built?" They never dreamed of making a drain plan—that was always left to the contractor. But fixing the style led to the choice of books to be consulted. A door from one, a window from another, and so on. But, thanks mainly to Ruskin, pioneers arose to set them free; men such as E. W. Godwin, A. H. Macmurdo, J. D. Sedding, Norman Shaw, Bentley, Bodley, Burges, and others, all of whom gave devoted attention to detail. And nearly all designed stained glass, wallpapers, fabrics, and furniture of every kind.

Many there were who kindled the revolt against over-elaboration and the debauch of decoration, which perhaps led some to excessive puritanical simplicity. The increasing use of machinery straightened the curvy lines of furniture, and the public were quickly beguiled into the delusion that simple things must be cheaper than elaborate ones. Did they yet realise that the exact opposite was the truth?

He referred to those matters merely to make clear that he was deeply conscious of his good fortune in finding himself there to enjoy the kind things that had been said, the hospitality given, and the honour they had bestowed; and also that he remembered that the circumstances of his time, the example of others, and, above all, the generous friendship and encouragement of brother architects, had been the real cause of his presence there; and for those things he would give most grateful thanks to his dyi

INSTITUTE OF ARBITRATORS

On Tuesday, November 15, a mock
tion was held at the Institute of Arb
28, Bedford-square, W.C., on a mat
cerning land agency, under the Agr
Holdings Act, 1923. The President
Institution, Mr. H. B. Chaplin Baid
present, together with many membe
Council, and there was a very good
ance of members.

Captain W. T. Creswell (member
cil) was the arbitrator; Mr. D. A. R
F.S.I., F.A.I., appeared for the a
and Mr. Claude W. Brighten, F.S.I.
respondent.

The arbitrator, for the benefit
present, outlined the nature of t
which concerned a claim made by t
cants under Section 10 of the Ag
Holdings Act, 1923, for compensati
spect to the diminished value of a
tural holding, for an amount in r
dilapidations under covenants of a
agreement, and the "custom of the
(Dorsetshire), and for expenses—
and surveyors' costs, etc.

Mr. Rawlence, in opening his c
duced the agreement with its repair
nants, on which he relied, detailed
condition of the holding and its d
value, and gave the cost of compl
the repairing covenants of the leas
"custom of the county" in respe
pairs. In support of his claim he c
Arthur Gadd, P.A.S.I., who gave
as to the condition of the holding,
tom of the county," and cost
good the repairs.

Mr. Brighten argued that he was
by the original tenancy agreement,
the tenancy that did in fact exis
his client and the landlord only
such repairs as a tenant was boun
order to comply with the "custo
county"; and whilst agreeing
figures put forward by Mr. Rawle
far as they came within his conte
jected to any figure being claimed
ing, since that was a repair the la
liable for in Dorsetshire. He furth
one year's rent in lieu of one ye
to quit, and a like amount for co
for disturbance, and argued there
improved rental value in the hol
to the depressed state of agricult

Clarke & Son, glazing; Malcolm McLeod & Co. granolithic.

Separate contracts were let for :—Woodblock floors, Hollis Bros.; asphalt flats, French Asphalte Co.; iron railings, T. W. Palmer; fanlight, Adams; steel sashes, Humphries, Jackson & Ambler.

The New Delhi.

We illustrate this week some views of the new Government offices at Delhi, erected from the designs of Sir Herbert Baker, A.R.A., F.R.I.B.A., who, in a paper at last Monday evening's meeting of the R.I.B.A., dealt with this work as well as that which has been carried out from his designs at Pretoria. A report of the lecture is given on page 809.

The Manor House, Hurley, Berks.

The old Manor House, which was a building of little merit and stood close up to the road, was pulled down, and the new house has been built further back in the delightful old garden. The house has been placed on a ferro-concrete raft well above flood level, and is constructed with small multi-coloured bricks with tiled roof. It was originally designed with the more usual hipped roof, but in order to reduce the cost the mansard roof was adopted, and this looks very well, though it would be greatly improved by the cupola over the central feature which was part of the design, but which unfortunately has not been executed. It is hoped, however, that this will be added later. A special feature of the plan is the grouping of the reception rooms and main bedrooms, staircase, and entrance in the shape of a "Y" and forming a suntrap for the loggia on the south side. The office wing has been planned so that the kitchen and offices do not overlook the garden. New entrance gates and piers have been built, a garage for three cars, workshop, men's messroom, toolshed, etc., and in the old stable building a chauffeur's room, gardener's office, and engine and battery rooms have been formed.

The hall and reception rooms have polished oak floors and panelled walls, the music room having the old eighteenth-century deal panelling added to and adapted as required and slightly stained. The drawing room is finished in dull green and gold, and the dining-room in parchment colour and dull gold.

The whole of the work, with the exception of some of the fireplaces and carving, which was done by Messrs. Brown, of Hammersmith, was executed by Messrs. W. A. James & Sons, of Maidenhead, who also installed the central heating. The electric-light plant, comprising 8-h.p. Hornsby engine, dynamo, batteries, etc., for lighting, electric fires, and vacuum cleaners, was installed by Mr. Cousins, of Sunninghill, Berks.

The architect was Mr. Berkeley Wills, F.R.I.B.A., of London and Marlow.

The following were sub-contractors :—Shanks & Co., sanitary fittings; Elsley, Ltd., railing to porch and grates; Osler, Ltd., electric-light fittings.

A Northern Polytechnic Scholarship.

A scholarship of the value of £50 per annum for two years, tenable at the School of Architecture, Northern Polytechnic, was offered by the Leeds Fireclay Company, Ltd., for the promotion of the study of terra cotta. In the preliminary stage of the competition for the scholarship, the following students were selected to take part in the final stage: E. W. Clark, C. S. Oakes, J. Singleman.

The final award has now been made as follows :—C. S. Oakes, £40; J. Singleman, £10.

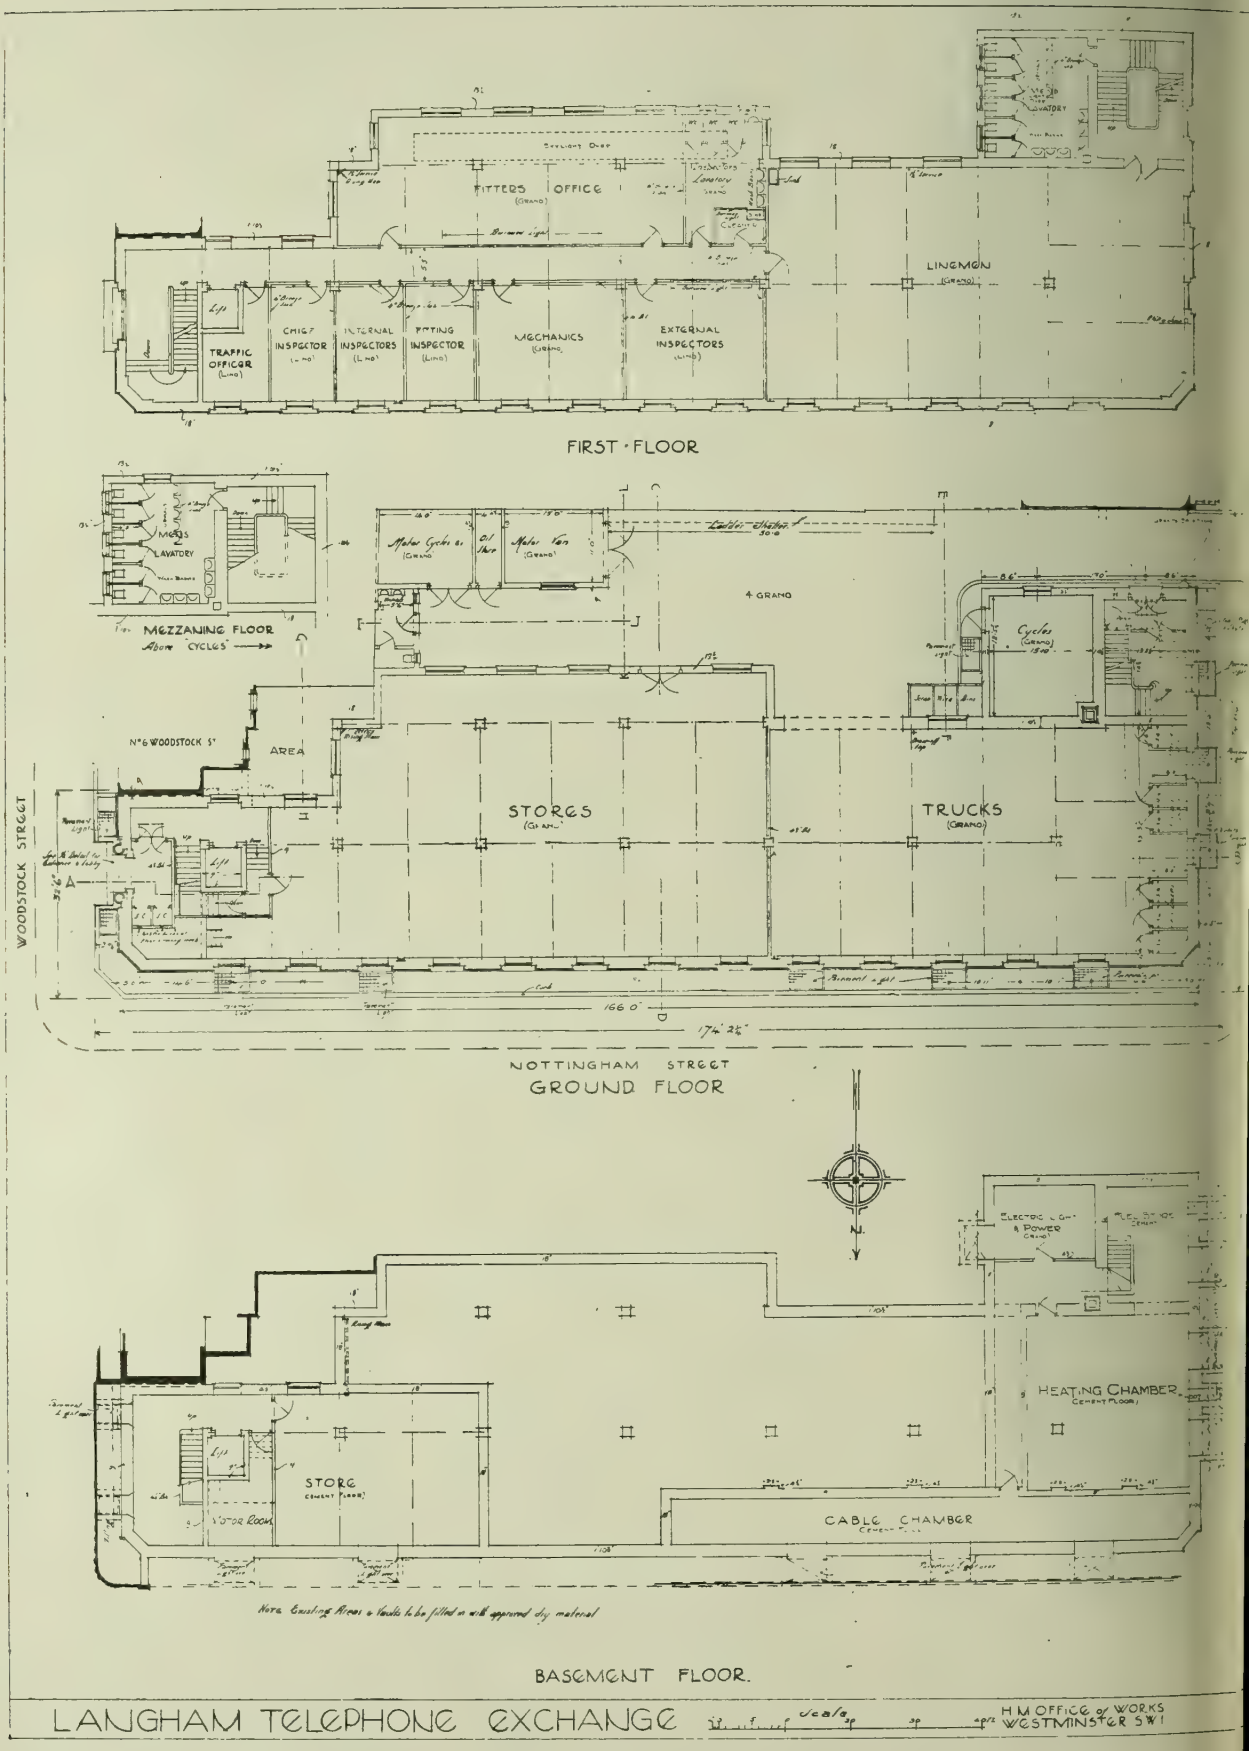
We illustrate the winning design this week.

THE LONDON SQUARES

At the second sitting of the Royal Commission on London Squares, presided over by Lord Londonderry, Alderman Charles Pascall gave evidence on behalf of the Metropolitan Boroughs' Standing Joint Committee. He said that the Committee was strongly of the opinion that existing squares and other open spaces within the terms of reference to the Commission should be preserved from building developments or other purposes destructive of existing amenities, and should be permanently retained as open spaces. His Committee, however, made the reservation that a Metropolitan Borough Council should not be precluded from consenting to the use of the square or open space in connection with a general estate development of an area in which it was contained, on such terms as might be deemed by the Council to be fit and proper, and on the condition that an equivalent open space was provided in the vicinity. These open spaces were not only an amenity to the residents of the houses surrounding them or abutting on them. Their continued existence was contributory to the well-being of the immense built-up area of London, and the reasons for their retention to-day were stronger than those which actuated their formation in the lay-out of estates. There could be no hardship on owners in preserving the *status quo*. The Committee were also of opinion that squares and other open spaces which must be maintained and preserved as such under existing statutes should not be incorporated in any new legislation. The Committee anticipated that a large majority of owners of squares and other open spaces would now see their way to agree to the prohibition of the erection of buildings thereon. Where necessary, compensation might be given.

Replying to a number of questions, Mr. Pascall said that the view of the Committee was that legislation should be passed to prevent these squares being built over. There might be circumstances, as in the case of town-planning, where compensation might be given. The compensation ought not to be in the same measure as if the property were taken away for another purpose.

Mr. Cecil A. Levy, on behalf of the Incorporated Society of Auctioneers and Landed Property Agents, said that it would be necessary to consider the future of each square separately and decide what course of action would be in the best interests of present and future generations. Where, for instance, houses were the primary need, development schemes ought not to be ruled out, though strict conditions should be laid down, having regard to the neighbourhood, as to the class of house to be erected and allowing for the maximum amount of air space possible. In a number of cases a central square served as a common garden to occupants of the surrounding houses. It would be an arbitrary and inequitable act to convert such squares for the general use.



Sir Howard Frank: Is it your view that the owner who has a right to build should be able to do so?

The witness: Subject to certain considerations. A residential district should not be built on so as to spoil the amenities of the locality, but there are some districts where the character of the neighbourhood has changed, and the need for the preservation of open squares does not exist.

The Commission adjourned.

School of Architecture, University of London. "Builder" Book Prizes.

The competition for the two book prizes offered by *The Builder* for measured drawings made by students of this school during the vacations of the Session 1926-27 has, we understand, been exceptionally keen. The names of the successful candidates are as follows: Senior Prize: R. Julian White. Junior Prize: R. N. Earle. Highly Commended: W. R. Hall, E. C. Northover, E. F. Starling.

THE WESTMINSTER ABBEY PROBLEM

By J. O. CHEADLE, A.R.I.B.A.

AT is the solution to the problem of minster Abbey? Shall it continue to be tional Valhalla, or must another shrine and? The following suggestions have based upon the assumption that the s that be will decide that the Abbey continue to be the resting-place of our s men. How, therefore, is the necessary accommodation to be provided? As one has for the past 30 years been inti- connected with and dwelt within the cts of this noble edifice, I should like e the opportunity to make a suggestion has not yet, to the best of my know- been put forward.

narily, my object is to find a solution while giving adequate extension, would fect the architectural grouping of this pile, or upset the ecclesiastical condi- which govern it. Briefly, my suggestion the ancient refectory to the south of oisters, of which part is still extant, be restored according to its original as the first step of a progressive scheme. would provide a very noble hall, giving ate wall and floor space for future ials. As the next step, the ancient n chapel of St. Katharine, of great cal interest, also partly extant, could eated similarly, and finally, the whole together by a memorial way uniting hitherto inaccessible but intensely in- ng features again with the Abbey.

houses between St. Katharine Chapel ld Palace Yard, and if possible those Abingdon-street, should be acquired, be- any ultimate scheme of building might e on the site of these and linked up as

advantages of this scheme are as s:

tly: The present familiar architectural grouping of the buildings would not be affected, or their surroundings cramped.

Secondly: Ancient portions of great historical interest of the monastic buildings would be preserved from future decay and opened up to public view.

Thirdly: No structural risk would be taken with the present edifice.

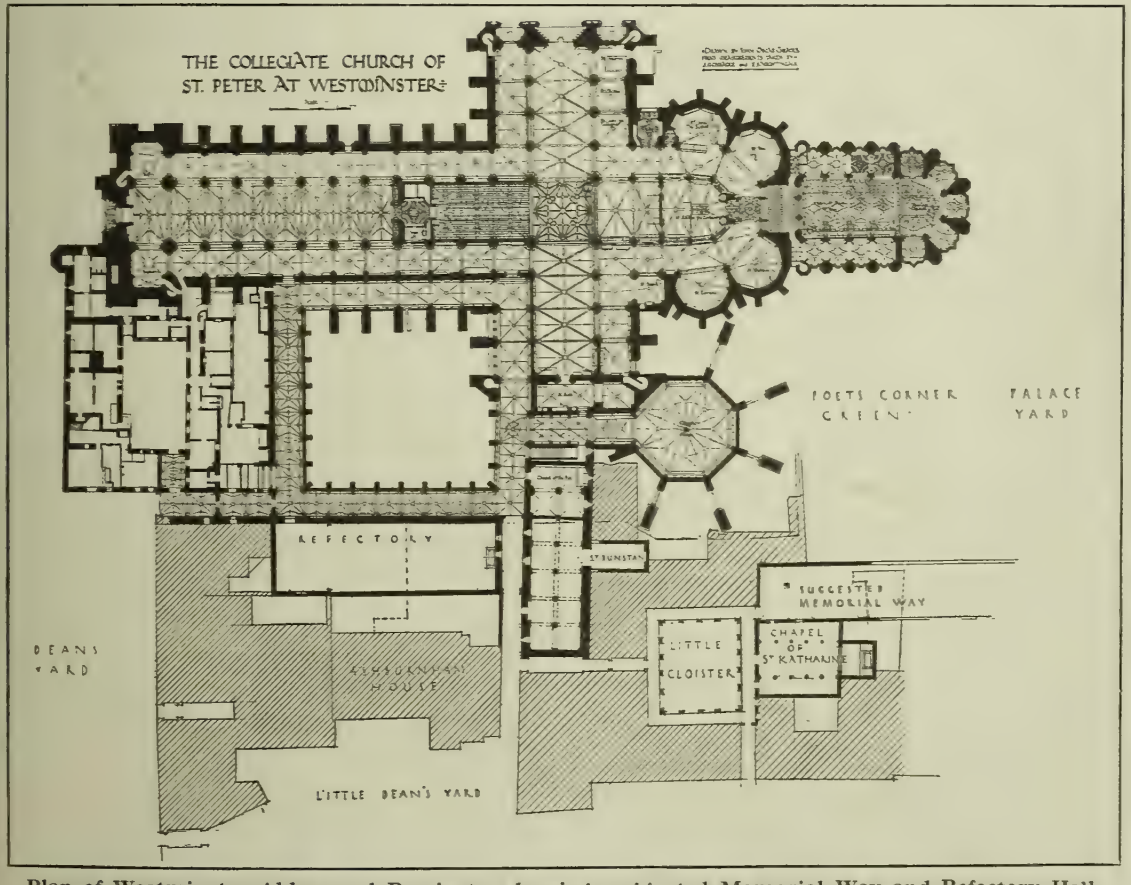
Fourthly: Accommodation would be provided at a minimum of financial outlay.

Nothing of an historical nature would be interfered with; the scheme would merely require the elimination of a modern house of no great architectural value, accommodation for the occupants of which could easily be found on the property belonging to the Abbey.

With regard to the suggestion to use the triforium, which was made in *The Builder* for November 11, although intriguing, this proposal has three great disadvantages:—

(*a*) The difficulty of providing easy access.

(*b*) The totally inadequate connection between the nave "triforia" and the triforium over the east end chapels.



(*c*) The very inadequate wall space provided, as the triforia consist of one open side, and the other practically all glass area.

The other suggestion, that a crypt be formed under the church, is fraught with grave structural risks, and although these might be overcome by modern engineering science, the scheme would still involve the disinterment of countless remains, an undertaking for which few would surely care to be responsible. The accompanying diagrams illustrate the gist of my suggestion.

In a letter to *The Times* on this subject, protesting against the building of any form of annexe to the Abbey, Mr. Edward Warren writes as follows:—"We have been told, upon undeniable authority, that there is still space in the Abbey itself, under modern conditions, for a hundred further interments. This, at the approximate rate of interment within its walls, should see us through for two centuries or so, and, in regard to commemoration, apart from interment, it has already been very pertinently suggested, by Sir Martin Conway, I think, that the walls of the triforium afford abundant space for tablets of moderate dimensions, which would be, at any rate, within the Abbey, and, fortunately, none too visible from the floor."

EXHIBITION NOTES

In the bright and pleasant exhibits of the R.B.A. at Suffolk-street, we are conscious of many very agreeable essays in colour, though there may not be anything of outstanding importance. In the large gallery is an easel decorated by a wreath to the memory of the late President, Solomon J. Solomon, R.A. The subject of the small painting is "An Allegory," and is a worthy, if small, tribute to the artist's skill in composition, drawing, and colour values. Though to many it may appear an overstatement, one must accord real decorative value to "The Shepherdess," by Fred F. Foottet: it is a very able piece of work. Another very pleasing picture with a decorative quality is "The Daffodils," by Chas. Harvey. M. Padwick's "Littlehampton" is a forcible picture of light and tone value. "On an Essex Farm," by Chas. Harvey, is well composed and has excellent colour value. A brilliant interior is "The Market, Besançon," by Leonard Richmond, and notwithstanding its sparkle it has breadth of effect. A very good picture is "Venus Deriding Mars," by J. H. Amskewitz; it is admirable in colour and very well designed in its balance of form and colour. 185, 271 and 264 are noticeable things. Amongst the watercolours we note 363. We should like to see more of this kind. It is a quiet, pleasing study of a two-masted boat in a river landscape. A telling little watercolour is "Ely" (419), by Ernest W. Haslehurst.

Plan of Westminster Abbey and Precincts, showing suggested Memorial Way and Refectory Hall.

Drawn by Mr. J. O. Cheadle, A.R.I.B.A.

OBITUARY

Mr. William Woodward, F.R.I.B.A.

We regret very deeply to record the death of Mr. William Woodward, F.R.I.B.A., which took place at his home in Hampstead at the age of 81. He was born on June 19, 1846, in London, and having completed his education, entered the office of Mr. Raggett, from where he went on to Mr. Arthur Cates, Surveyor to the Crown Estates. Later he set up in practice with the late Mr. Eugene Argent, in the Adelphi, afterwards taking offices at Southampton-street, W.C.2, where he practised on his own account. He was elected an Associate of the R.I.B.A. in 1879 and Fellow in 1905, while he became a professional associate of the Surveyors' Institution in 1882 (Fellow in 1890). Amongst many appointments Mr. Woodward had been Surveyor to the Crown Estate Paving Commissioners, and to the Honourable Artillery Company, and he had been hon. architect to the Metropolitan Public Gardens Association. Amongst his works are :—Premises in Osnaburgh-street for Maple and Co.; Brooks's (as it was then) in Regent-street; buildings in Piccadilly on site of Egyptian Hall; the corner of Piccadilly and Haymarket; corner of Duke-street and Jermyn-street; corner of Jermyn-street and of St. James's-street; premises for International Sleeping Car Co., Cockspur-street, while he was joint architect with Mr. Walter Emden (and on his death, with Mr. E. A. Gruning) for the planning of the Piccadilly Hotel. St. Saviour's Church, St. Alban's and Rumpelmayer's, St. James's-street, are also of his work, while in conjunction with Messrs. E. Newton and Sons, he rebuilt the County Fire Office. He was a great worker, and at the age of 78, designed his own house in Church-row, Hampstead, where he died. Being by birth a Londoner, he loved London, and was a keen student and critic of street widenings, new roads, etc., while all questions of public amenity were of great interest to him. He showed this in a practical way by helping to secure the removal from the parks of the temporary public offices erected during the war. He published "London as it is and as it should be," in which he advocated the remodelling of Trafalgar-square with terraced gardens, while recently he had revived an old scheme for a separate building on the old Palace Yard side of Westminster Abbey, a kind of Valhalla and Campo Santo—intended as a resting place for memorials to the illustrious dead. He was very active in the affairs of the R.I.B.A., and his conscientiousness and vigorous and independent outlook led him to wage war upon many things he thought capable of improvement, battles which, however, were conducted in the best spirit and without feelings of enmity towards the persons concerned. He occasionally adversely criticised the actions of the Council of the R.I.B.A., while for many years he spoke upon the Annual General Report at the Annual General Meeting. His last speech on this subject, at the meeting in May, 1927, was his thirty-third in succession. Mr. Woodward was a member of the Council from 1911 to 1914 and served on the Finance and House Committee during that period, being elected Chairman of the Committee in 1913-1914. For 14 years he was Treasurer of the Council Dinner Club, and only retired from that position last year. He was also a member of the Practice Standing Committee from 1909 to 1913, and Vice-Chairman of the Committee from 1911 to 1913. He took a great interest in public affairs. He was a member of the Westminster City Council and was Mayor of Hampstead from 1910-11. Mr. Woodward was also much concerned with Freemasonry, being a past-Assistant Grand Superintendent of Works, while he was a founder of the Eurydice Lodge. He was a past-Master of the Glass-Sellers' Company. His was a life of activity and usefulness, and to all who came in contact with him his death will leave a gap not easily to be filled.

Among those present at the funeral were : Mr. Charles and Mr. Frank Woodward (sons), Mr. A. R. and Mr. F. G. Woodward, Sir Reginald Blomfield, Mr. Ian Macalister, Mr. Alexander Goddard (secretary of the Surveyors' Institution), Sir Walter Schroder, Sir Bignell Elliott, Mr. H. V. Ashley, Sir Andrew Taylor, Mr. Keith Young, Mr. Douglas Young, Mr. H. P. Burke Downing, Mr. J. M. Theobald, Mr. C. H. Mabey, Mr. Alan Munby, Mr. W. T. Plume, Mr. D. B. Niven, Mr. Arthur Keen, Mr. Stanley Burmester, Mr. E. J. Brown.

Mr. George A. Kerr, F.R.I.B.A.

We regret to announce the death, on November 13, of Mr. George A. Kerr, F.R.I.B.A., of Mar-street, Alloa. He was a native of Dumfriesshire, and began business in Alloa with the late Mr. M'Culloch about 30 years ago, and was responsible for many public and private buildings.

Mr. A. G. Wilkinson, F.R.I.B.A., and Mr. Percy Ruskin Allen.

We regret to record the death on November 4, at Gravesend, of Mr. Arthur Grosvenor Wilkinson, F.R.I.B.A. Also of Mr. Percy Ruskin Allen, O.B.E., A.M.I.C.E., M.I.M.E., M.I.E.E., which occurred in London on November 7.

We extract the following notices from the current issue of the *R.I.B.A. Journal* :—

Mr. W. O. Milne, A.R.I.B.A.

Mr. William Oswald Milne, for many years an Associate of the R.I.B.A., died on August 31 last, at Ipswich, as the result of an accident. He was in his 81st year. He was articled to the late Sir Arthur Blomfield, A.R.A., and began practice in London in 1872. Among the buildings he designed was the Walsingham House (which stood at the corner of Piccadilly and the Green Park, and which after about 20 years' life was pulled down to make way for the Ritz Hotel), the Sandringham Hotel at Hunstanton, and the original Royal Station at Wolferton. He was responsible for many houses and schools in various parts of the country, and carried out many church restorations in Norfolk and elsewhere. His son, Mr. Oswald P. Milne, joined him in partnership in 1907.

Mr. George Scamell, F.R.I.B.A.

Mr. Scamell, who came of a Somersetshire stock, was born in London on December 29th, 1840. He was educated at King's College School. In 1864 he entered into partnership with Mr. R. Davison, which lasted six years. During this period the firm was responsible for a pier at Kirkwall and a new brewery for Messrs. Phipps at Northampton. Mr. Scamell was best known as an architect of breweries, which he erected in various parts of the country. Amongst these were Threlfall's brewery at Liverpool, Gordon's brewery at Peckham, Freeman's brewery at Burton, and Reid's brewery at Clerkenwell-road; and Mr. Vandenberg's at Antwerp. He published in 1871 a book entitled "Breweries and Maltings."

Mr. F. G. Green, A.R.I.B.A.

Mr. Frederick George Green, who died in his home near Cape Town on June 10, was born near Westminster Abbey in 1850. Originally studying for the medical profession, he subsequently decided to turn his talent for drawing to architectural work. After a decade of activity in the homeland he established a practice in Melbourne, Australia, where he erected several outstanding buildings. Later he practised in Johannesburg for a short time and erected various buildings, including Robinson's Bank and the Masonic Hall. From there he came to Cape Town to supervise the carrying out of his plans for the erection of the City Hall, in the competition for which his designs had been successful.

Mr. E. D. Brown, A.R.I.B.A

Mr. Edwin Dace Brown was educated at Woolwich High School, the Royal College at Mauritius, and the Cape Town School of Architecture. He was articled to Mr. Frank Humphreys, F.R.I.B.A., and on completion of his articles became an assistant to Mr. Percy Pratt, Theobalds-road, London, and was later an assistant to Mr. G. Hornblower, F.R.I.B.A. He entered H.M. Office of Works in 1905, where he remained until his death.

SOUTH WALES INSTITUT OF ARCHITECTS.

On Novemer 17, at Cardiff, Mr. How Robertson, Principal of the Architectu Association School of Architecture, gave lecture before the South Wales Institute Architects and the Institute of Builde The modern architecture of Europe a America, he said, offered strange contras Expression of national character was m evident in modern work than in the pa Divergencies were more marked. Amer took the lead in rapid growth and consti tional daring, but the architectural treatme of her engineering feats was still as a r inadequate. American cities expressed terr vitality and endeavour, which had resul in chaos, as there had been a lack of orde growth and planning of cities for fut needs. This was rapidly being remedied.

The Ford factories, the steel framing of t skyscrapers, such structures as the Woolwo and Telephone buildings were amazing sp tacles of enterprise and daring. The Black a Gold Radiator building, in New York, w the finest piece of advertising in the wor A gregarious nature and the need for co fort in a strenuous life produced great apa ment hotels like the Ritz Tower and t Shelton. The whole working of such bui ings, as indeed the whole of existence in American city, depended upon machine Without mechanical appliances the sk scraper was an impossible development.

The most striking contrast to America w Spain, where architecture had no direct guidance and ran riot. Some of the n buildings in Barcelona represented the vi spirit of chaos and rebellion, but with a guiding principle. They were purely pressions of temperament and not of no In Holland was found a serious effort modern architecture. It was the one coun which could claim a national modern st Generally the lines of the buildings w horizontal, an echo of the long lines of flat country and the canals.

Austrian development in architecture preoccupied with social needs, and the bui ing of schools, flats and baths, for the wo ing classes. Labour ruled, and everyth was done for the worker. The buildings w simple but fine, and provided as far possible an environment approaching ideal. Vienna was wisely ensuring a bet and healthier future generation for the wo ing classes. Denmark was eclectic, and occupied with style, while Sweden had vided some of the finest craftsmanship artistry in modern European architectur

France, by contrast, was daring in exp ments with form, and was attacking problem of an architecture of our economical, hygienic, simple, and practi on lines of logical experiment. The cubist houses were ultra-modern, and posed a type of tenant who had thrown all his old ideals and traditions. But as gards light and air and space they marke great advance, and much was to be lear from the Spartan elimination of every fea which was not considered as essential.

England was still conservative. housing remained the best in the world; working-class dwellings provided a hi standard of comfort than any others. required above all a greater national inte and pride in architecture—groups of lightened and public-spirited people could help to prevent the outcrop of shackle bungalows in our suburbs, and a our magnificent new arterial roads, whe wonderful opportunity for orderly and att tive development was being missed. architecture we lacked imagination, missed big opportunities for the sake of small consideration of supposed econ Poor and makeshift building was the w of all investments. Cardiff had shown way to many a bigger city by her ma cent civic centre. It was a nucleus of di and order, from which should radiate fu effort to make the rest of the city's a tecture worthy of those buildings.

THE LONDON SOCIETY

LONDON SQUARES.

Friday last week, Sir Edgar Bonham , K.C.M.G., took the chair at the Royal y of Arts' premises in Adelphi, when '. Loftus Hare read a paper on "Lon-quares" to the London Society. Deal-st with the statistical aspect, the lec-said that in the year 1905 after certain us warnings from Hammersmith and ngton, a Bill was presented to Parlia-having for its object the prohibition of ection of buildings on London's Garden es. A schedule attached to the Bill repared, so the lecturer believed, by the ity of the London County Council, gave llowing figures :—

owners were possessed of :—
garden squares equalling 287 acres.
garden enclosures equalling 162 acres.

open spaces equalling 449 acres,
an average of one acre per square.

London County Council minutes for 12, 1927, gave figures which were y different, and significant. A joint ttee working upon the old list had corrections which reduced the number ares by twelve and the acreage by . Apparently in 20 years London had even acres of its open spaces, and this movement which surely should be d, before it went too far. He went o the fate of the Bill of 1905. It failed re the approval of the House of Lords ttee, and in 1906 was followed by a nodest endeavour. The owners (66 in r) who had been willing to agree to rms of the Bill were then approached e Act, which was fortunately passed, l the desired protection for 64 of the total. It was a small beginning. Lon could not affirm that they had been thout warning of their danger. There een three battles and, happily, one say, three victories on the right side. des-square was protected by a judicial n after the gates had been locked by vading builder, while St. Peter's was sed by the Hammersmith Borough l for £5,660 for one and three-quarter

gh he would not be able to conduct lete visitation to or describe more than incipal squares, he would like to give ace of honour to St. Peter's Square. a very pleasant place confined almost y to residential houses of an early 19th y type. About 20 blocks of houses, to a block, occupied the oblong side square. The west side road running Mall had most of the traffic and the ide was very quiet. The houses were ly unique in style. They were plain-tucco, mostly painted buff, with half-kitchens and breakfast rooms, stone o front doors, long French windows, rought-iron balconies painted green. ddle house was set a little back, was and colonnaded in Ionic style. The was well stocked with park trees of cia and other kinds, giving rich shade mer and graceful ornament in all sea-The garden was much used by quiet folk, children, and aged persons. ird great battle was concerned with mpt to put a 20 acre vegetable market he Foundling site. The lecturer then ed to describe several others of the squares, including London's premier St. James's. The square dated from e of Charles II., and as to the houses, rdens, and the paving, was a model type. It was built by the Earl of St. who was possessed of 45 acres of upon which his estate was laid out. her first-class residential squares were lish, Grosvenor, Berkeley, and Port-The influence of the approach of com-development was seen when residents ay to business tenants. The garden to have an immediate connection with sons who used the buildings, and the o regard the enclosure as private had less force. We saw this in the case of Russell-square, the largest garden in Bloomsbury. The buildings were fine and simple, except some of the modern hotels, and suggestions had been made by distinguished town-planners that this square might be thrown open to the public. Bloomsbury-square was once the front garden of Southampton House, destroyed during the Gordon Riots. The garden had undergone the usual changes from Dutch ornamentation to more British style. The coming of Victoria House, a neo-classic monster, threatened to transform the architecture and the general uses of this square. In the main Bloomsbury, Bedford-square, Gordon, and Tavistocks-squares were devoted to learning, and all of them had charms which none would care to lose. He submitted that some consideration should be given to the scholar who worked quietly and incessantly in the many libraries and reading-rooms of the learned squares. Special interest attached to Queen-square, which, so far as the lecturer knew, was one of the few that was almost entirely enclosed and protected from through traffic. It was railed at the north. It had a variety of buildings, the Jews' College, several other educational establishments, the children's hospital, and an Italian one, while the Church of St. George the Martyr stood in the corner. Dealing with the St. Pancras' squares, the lecturer said that the parish of St. Pancras was of immense size and had within it some 12 squares. Ampthill-square, which was a noble name, was cut in two by the main line from Euston Station, and its peculiar bi-sected lozenge-shape was perhaps unique. He had fears for the preservation of its stuccoed houses and he was sure there were eyes fixed on its rather forlorn garden. Fitzroy-square was well known as the French and Swiss quarter and the hospitals and institutions would, he was sure, put up a stiff fight against any attempt on the garden.

Speaking of Mornington-crescent, the lecturer said that the crescent once was in form true to its name. Together with Harrington-square, it provided an acreage of importance and an air space of considerable volume ventilating the main road to Camden Town. Into this pocket of air had been thrust an enormous building, which would shelter many hundreds of workers and would give out the aroma of tobacco leaf in place of the subtly curative exudation of deciduous trees. Continuing, the lecturer said it was useless to quarrel with an accomplished fact, and we could but record with regret and briefly the long story which ended by the spoliation of Endsleigh-gardens. In the middle of the 18th century what was called the New Road was cut by the Turnpike Act from Islington to Paddington. It was the familiar Pentonville, Euston and Marylebone Road. The land was then opened free of building and resting in quiet isolation was the Bedford Nursery Garden, leased by Mr. Hall, covering an acreage of about five acres. The road, 150 ft. wide, divided Mr. Hall's garden in two portions, the north was Euston-square and the south bearing the name of Endsleigh. There came a day, however, when £25,000 an acre was too tempting a bait for the owner of that beautiful garden.
